RICKER, GEORGE HODGEN. An American educator, died April 27, 1912. He was born in 1821 and graduated from Dartmouth College in 1845. He was for many years a teacher in seminaries in New Hampshire and in Maine, and was for several years professor in Greek in Hillsdale College, Mich. He afterwards was principal of the Fryeburg Academy, at Fryeburg, Me. He retired from active teaching several years before his death after he had been engaged in educational work for 55 years.

BITCHIE, SIR RICHMOND. An English public official, died October 14, 1912. He was born in 1854 and was educated at Eton and at Trinity College, Cambridge. He left Cambridge and entered the India office in 1877. In 1883 he was appointed private secretary to the parliamentary under-secretary of state. He held this office under successive chiefs until 1892. He afterwards rose to be principal private secretary to the secretary of state and in 1902 was appointed secretary in the political and secret department. In 1909 he was appointed by Lord Morley, permanent under-secretary of state, one of the most important positions in the English cabinet. He held this position until the time of his death. In 1887 he married the eldest daughter of William M. Thackeray.

RIVERS, STANDARD OF PURITY FOR. See SANITATION.

ROADS AND PAVEMENTS. Never in the history of the United States was so much road and street improvement work in progress or projected as in 1912.

ROADS. Until within a few years past little was done outside the cities and a few States to provide other than dirt roads or at best roads surfaced with gravel. Massachusetts and New Jersey led the way in State aid, and one by one the other States have followed—generally a long way behind. Counties have also taken

up the work, either alone or in conjunction with the States, and the same is true in lesser degree of towns and townships in the older and more thickly settled parts of the country. A number of years ago the federal government began to consider road improvements, confining its efforts to investigations and reports. Later on the office of public roads was established in the United States Department of Agriculture. The work of investigation was continued in the office, the laboratory, and the field, and finally short sections of experimental improved roads were built to test different types of surfacing and different modes of construction. In the year ending June 30, 1912, the office of public roads built the equivalent of 88 miles of 14-foot roadway at a cost of \$91,877. With the exception of two experimental roads these were known as object-lesson roads. For many years strong efforts have been made to get Congressional authorization and appropriations for extensive federal road improvements. In fact, an organization, known as the National Highway Association (Charles Henry Davis, South Yarmouth, Mass., president), has gone so far as to publish a map of the United States showing "a broad and comprehensive system of national highways to be built, owned, and maintained by the national government," comprising a total of no less than 51,025 miles. An editorial writer in *Engineering News* of May 16, 1912, estimates that this system—since it is designed primarily for automobile traffic and would be built under difficulties in many of its parts—would cost an average of, at least, \$13,000 a mile, or a total of \$663,000,000, and that allowing 10 per cent. for maintenance and repairs and only 4 per cent. for capital charges the annual cost would be \$92,000,000. This project is mentioned to show how rapidly federal road construction would run into the billions, once it was begun on a "comprehensive" plan. Few of the road enthusiasts have gone quite so far as this, but fewer yet have seriously counted the cost. As a result of various, more or less ambitious, proposals for federal aid, Congress appropriated \$500,000 for road construction in the several States, in conjunction with either State or local governments, the latter to provide two dollars for each one dollar of federal money. This money is to be expended by the Secretary of Agriculture in coöperation with the Postmaster-General. It is to be used to improve "the condition of roads selected by them over which rural delivery is or may hereafter be established." Congress also appropriated \$25,000 for the use of a joint Congressional committee investigation "of federal aid in the construction of post roads." The obvious intent of the act was that the \$500,000 fund should be divided as equally as may be among the 48 States of the Union. This would give a little over \$10,000 to each State, and with State or local appropriations would give \$30,000. Obviously this will do little more than provide a few miles of object-lesson dirt or gravel and experimental roads in each State, or two or three miles of macadam; but it is equally obvious that it will stimulate local interest in good roads and that the bill may prove to be an opening wedge through which hundreds of millions of road money may yet flow from the federal treasury.

An interstate road project, to be carried out

by the various States or counties traversed, is what is known as the Meridian Road, extending from Winnipeg, Man., to the Gulf of Mexico. An automobile reconnaissance of the portion of this road lying in South Dakota, as well as projects for several other trunk lines across that State, was described by Samuel H. Lea, State engineer, in the *Municipal Journal* for September 26, 1912. The same author described in *Engineering News* of October 10, 1912, the construction, or improvement, in two days' time of the portion of the Meridian Road extending across Codington County, South Dakota, a distance of 24 miles. Under a pre-arranged plan the business men of Watertown, S. Dak., and residents of other communities along the road, turned out and regraded and shaped up the highway as well as could be done with local materials along the route. Such spectacular and spasmodic efforts give results of relatively temporary value, except in the way of education and stimulus. The real progress now being made in high-class road construction in the United States, other than necessary work of investigation and education, is due chiefly to State and county highway improvement. Only the latter can be given further mention here except to note that New Jersey, on one side of the continent, and California on the other, afford notable examples of highway construction by counties—although in New Jersey most of the county work has the assistance of State funds and general State engineering supervision. California, of late, has been spending millions through county highway commissions, besides the large amount of work which the State is doing.

Of the 48 States of the Union, 26 had done more or less in the way of State aid for road construction up to the early part of 1912. This had ranged all the way from the \$50,000,000 of bonds authorized (and largely spent) in New York, to small annual appropriations. Another \$50,000,000 of State aid in New York was made possible by a constitutional amendment adopted by popular vote in November, 1912. Among the 42 Ohio constitutional amendments submitted to popular vote on September 3, 1912, one increasing the bond limit for inter-county roads to \$50,000,000 was lost, having been voted down in 48 counties, although the total majority against it was less than 2000 out of a total of 550,000 votes. Pennsylvania has entered on a State highway network project, under legislation of 1911, which will presumably cost \$50,000,000 or more. California has authorized \$18,000,000, and Maryland \$5,000,000 for such work.

A large mass of statistical and other data on State road aid and State highway administration resulting from a special investigation may be found in *Engineering News* of March 28, 1912. Reviews of State highway work in Massachusetts, New Jersey, Connecticut, and California appeared in the *Engineering Record* for September 28, 1912, and still more information on the California work in the *Municipal Journal* for September 26, 1912.

No marked change in materials and methods of road construction occurred during the year. Water-bound macadam continued to give place to bituminous-bound where the traffic demanded and the public purse could afford it. For years to come, dirt or at best gravel will continue to form the wearing surface and foundation of by

far the larger part of the hundreds of thousands of miles of roads of the country. There were 2,199,000 miles of public roads in the United States proper in 1909, of which only 190,467, or 8.66 per cent., had been improved or graded, drained and provided with a hard surface. Much of the unimproved mileage could be vastly improved at an expense well within the means of the localities directly concerned by simple means of drainage, grading, and cross-sectional shaping, whereas even the least expensive macadam construction, if extensively gone into, would bankrupt thousands of rural communities.

PAVEMENTS. Growth of heavy traffic is increasing the need of substituting the more permanent wearing surfaces for macadam. Bituminous concrete, asphalt, brick, creosoted-wood blocks, some of the harder sandstones and, for the heaviest traffic, granite, are the principal kinds of pavement now used. Portland cement concrete is gaining in use. The organization of city officials for standardizing paving specifications is continuing its works with promising results, as is also the American Society of Municipal Improvements.

REFERENCES. During the year new editions appeared of George W. Tillson's *Street Pavement and Paving Materials* (New York) and Prof. F. P. Spalding's *A Text-Book of Roads and Pavements*. New books in this field were: Francis Wood, *Modern Road Construction* (London and Philadelphia), a British book; L. W. Page, *Roads, Paths and Bridges* (New York), a small popular book, and W. G. Harger and E. A. Bouney, *Handbook for Highway Engineers* (New York).

ROBERTS, ERNEST STEWART. An English scholar and educator, died June 17, 1912. He was born at Swineshead, Lincolnshire, in 1847 and was educated at Boston, England, and at Caius College, Cambridge. In 1870 he became a fellow at Caius College, and six years later was appointed tutor. In 1885 he was made senior tutor, and in 1894 president of Caius College. In 1903 he was chosen master to succeed Ferrers. In addition to his service in this college he was equally active in the university. He was for a time university lecturer in comparative philology, and held the office of proctor in 1876 and 1884. He was vice-chancellor from 1906 to 1908 and served on the council of the senate continuously from 1904 to the time of his death.

ROBIE, FREDERICK. An American public official, former governor of Maine. He was born in Gorham, Me., in 1822, and graduated from Bowdoin College in 1841. He studied medicine at the Jefferson Medical College in Philadelphia and practiced as a physician until the outbreak of the Civil War. He served throughout the Civil War and was brevetted lieutenant-colonel of volunteers for gallantry in service in 1865. After the close of the war he engaged in business in Portland, also taking an active interest in politics. He was at various times member of the State legislature and from 1883 to 1887 was governor of the State. He was a member of the boards of directors of many State institutions and held office in several banks and insurance companies in Portland.

RODENBOUGH, THEOPHILUS FRANCIS. An American soldier, died December 19, 1912. He was born at Easton, Pa., in 1838 and was edu-

cated at Lafayette College. At the outbreak of the Civil War he was engaged in the mercantile business. He was appointed second lieutenant in the Second United Dragoons in 1861 and within two months was promoted to be first lieutenant. In 1862 he was made captain. He took part in the battle of Gaines' Mills and the Peninsular campaign of 1862. He was captured at the battle of Manassas and was shortly afterwards exchanged. At the battle of Beverly Ford in June, 1862, he was wounded. At Gettysburg he had command of his regiment. He was again wounded at Trevilian Station in 1864. While leading his regiment at the battle of Opequan in September, 1864, he lost his right arm. He was granted leave of absence and on his recovery was made colonel of the 18th Pennsylvania Volunteer Cavalry. By direction of the President he was especially assigned to command a brigade of regulars and volunteers in the district of Clarksburg, W. Va. He received a medal of honor for gallant conduct at Trevilian Station and was given five brevets for his war service. For gallantry at the battle of Cold Harbor he was made brigadier-general. In the winter of 1865 he served as inspector-general in Kansas and later with the Second Cavalry. He was major of the 47th Infantry, serving in the northern part of New York until December 15, 1870, when he was put on the retired list with the rank of colonel. He then became governor of the Soldiers' Home at Washington, holding that position for one year. From 1890 to 1901 he was chief of the Bureau of Elections in the City of New York. He was one of the founders, and from 1878 until the time of his death, secretary of the Military Service Institution. He was the author of *From Everglade to Cañon with the Second Dragoons* (1875); *Afghanistan and the Anglo-Russian Dispute* (1885); *Uncle Sam's Medal of Honor* (1886); *Autumn Leaves from Family Trees* (1892); *Sabre and Bayonet* (1897). In 1896 he edited *The Army of the United States*, and in 1899 was editor of the *Journal of the Military Service Institution*. He was editor of the Military Department in the *New International Encyclopædia*.

ROGERS, H. H. See PRESIDENTIAL CAMPAIGN CONTRIBUTIONS.

ROGERS, ROBERT CAMERON. An American poet and author, died April, 1912. He was born in Buffalo in 1862 and graduated from Yale University in 1883. He engaged in journalism and became editor of the Santa Barbara (Cal.) *Morning Press*. He contributed verses to many magazines. Among his published writings are *Wind in the Clearing*, and *Other Poems*; *Will o' the Wisp*; *Old Dorset*; *Chronicles of a New York Country Side*; *For the King*, and *Other Poems* (1899); *The Rosary*, and *Other Poems* (1906).

ROMAN CATHOLIC CHURCH. Church statisticians estimate the Catholic population of the world in 1912 at 292,787,085 and of this total, 29,000,000 are in English-speaking countries. In round numbers there are 1754 Catholic bishops in the world; 11 apostolic delegates; 155 vicars apostolic; and 68 prefectures apostolic. As appointments now average the whole hierarchy of the world is renewed about every fifteen years. The religious orders and congregations of men number 116.

There are 15,015,569 Catholics in the continental United States according to the 1912 edi-

tion of *The Official Catholic Directory*, an increase of 396,808 over the figures of the preceding year. This 15,015,569 does not deduct 15 per cent. for children and infants, as was done by the government in its census of 1906-09. The Catholic population shows a gain of 4,038,812 for the decade.

There are 17,491 priests. Of these 4495 are members of religious orders, a gain of 407 priests. Four hundred and seventy-eight additional churches are recorded, and the general summary shows 13,939 Catholic churches. Of these 9256 have resident priests, the other 4683 being mission churches, that is, attended from neighboring parishes.

There are 17 archbishops, each of the 14 archiepiscopal sees being occupied. Three archbishops are cardinals, and three are titular archbishops, Bonzano, Keane, and Spalding. There are 84 bishoprics. All told there are 101 bishops, 17 of these being coadjutor and auxiliary bishops. In addition, there are two arch-abbots and 15 abbots.

Eighty-three seminaries are located in various parts of the country, with 6000 students. There are 229 colleges for boys and 701 academies for girls, and more students in the 229 colleges for boys than there are in the 701 academies for girls. In 5119 parishes schools are open, with an attendance of 1,333,786. Besides the parochial schools there are 289 orphan asylums, in which 47,111 orphans are taken care of. Counting the children in parochial schools, the number of young ladies and young men in academies and colleges, and including the orphans and children in other charitable institutions, there are under Catholic care in the United States 1,540,049 young people. The five States having the largest number of Catholics rank as follows: New York, 2,778,076; Pennsylvania, 1,616,920; Illinois, 1,447,400; Massachusetts, 1,381,212; Ohio, 745,271.

The Catholics in the British Empire number 12,068,814, an increase of 392,559 over the total for 1911. The totals for the sub-divisions of the empire are: England and Wales, 1,793,038; Scotland, 547,336; total for Great Britain, 2,340,374; Ireland, 3,242,670; total for British Empire in Europe 5,800,526; in British America, 3,195,916 (of these Canada has 2,824,558); in Australasia, 1,184,500; in Asia, 2,288,898 as compared with 1,975,305; Africa, 489,965 (in 1911, 380,105). These figures are officially computed for the *English Catholic Directory* for 1913.

ITALY. In spite of repeated rumors concerning his ill-health Pope Pius X. continued during the year to give public manifestation of his physical and mental ability to govern the Church, by repeated audiences, and the promulgation of many decrees and letters on matters of legislation and discipline. Among these documents of special importance were the letter to the South American bishops on the condition of the native Indians; the decrees on the establishment of a special department of the Consistorial Congregation for spiritual care of emigrants; defining the duties of the Third Order of St. Francis; the establishment of the Ruthenian Rite in Canada; the settlement of the controversy over membership in Catholic and in non-sectarian labor unions in Germany and the censure of a syndicate of five Catholic dailies in Italy for lax opinions on

the question of the temporal power of the Pope and the integrity of the Papal state. The first part of the new code of canon law was sent to the bishops of the world for study and instruction. It will take two years to complete the work. The higher criticism writings of the Dominican Father LaGrange, director of the Biblical School at Jerusalem and editor of the *Revue Biblique*, were condemned as unfit for reading or consultation in Catholic seminaries. He resigned both these positions. A consistory was held December 2 at which Bishop Charles de Hornig of Veszprem, Hungary, was created a cardinal and the red hat was given to five of the cardinals created at the previous consistory (November 27, 1911); Nagl, Bauer, Vico, Cos y Macho, and Almaraz y Santos. The number of cardinals in 1912 was 61 (the full number of the sacred college is 70) divided nationally as follows: From Italy, 33; Austria-Hungary, 5; France, 6; Spain, 6; United States, 3; Germany, England, Belgium, Ireland, Brazil, Holland, and Portugal, one each. Of the whole number, 33 have been appointed by the present Pope Pius X. Cardinals Fischer, Samassa, Couillié, and Copeclatro died during 1912, making 38 deaths during the pontificate of Pius X. A committee was named by the Pope to invite the Catholics of the world to join, during 1913, in a general celebration of the edict by which, in 313, Constantine gave peace to the Christian Church.

FRANCE. Catholicism showed many evidences of vigor in France, in spite of the rupture of the Concordat, in the building of new churches in the neglected quarters of large cities, the erection of new schools, and the inauguration of works of benevolence in the interest of the working classes. Under the appeals of Maurice Barrés protests were made against the government policy of letting the churches, many of them national monuments, fall into decay. Since 1902, 20,000 schools belonging to religious congregations have been closed by the government. Of these, according to a report made by Canon Laude for the Société d'Education, 8000 have been reopened by lay teachers or secularized religious and Catholics have voluntarily contributed 45,000,000 francs for the support of these schools. Of this amount, 30,000,000 francs went to pay the salaries of 8000 men and 25,000 women teachers.

GERMANY. The activity of German Catholics was specially manifested at the Marial Congress at Treves (August 4-6); during the Catholic Day gatherings at Aachen (August 12-15), and at the various Windthorst centenary celebrations (January). The Centre party successfully aroused the indignation of the country in an agitation against duelling in the army, begun over the dismissal of a Catholic officer who refused a challenge on conscientious grounds. The repeal of the anti-Jesuit laws was strongly urged. Four priests were sentenced to six months' confinement because their request to be excused from service as military reservists was judged a breach of military discipline. The Pope's decree on the question of Catholics joining non-Catholic labor unions was well received. See **GERMANY**.

UNITED STATES. Mgr. John Bonzano, rector of the College of the Propaganda, was appointed apostolic delegate to the United States, and consecrated Archbishop of Mitylene March

3, and assumed the duties of his office in February. Extraordinary public demonstrations of welcome marked the return in January from Rome of Cardinal Farley to New York and Cardinal O'Connell to Boston. Two new dioceses were created during 1912: Corpus Christi, Texas, from the vicariate of Brownsville, and Kearney, Neb., from the former boundaries of the diocese of Omaha. The Rev. James Albert Duffy was appointed Bishop of Kearney. The pallium was imposed on Archbishop James J. Keane of Dubuque (January 21), and Archbishop Edmond F. Prendergast of Philadelphia (January 31). These bishops were appointed: Denis O'Connell, Richmond, Va.; P. A. McGovern, Cheyenne; Austin Dowling, Des Moines; John G. McCort, auxiliary of Philadelphia; Joseph H. Conroy, auxiliary of Ogdensburg; Edward A. Hanna, auxiliary of San Francisco. Bishop P. A. Ludden of Syracuse, N. Y., died and was succeeded by his coadjutor, Right Rev. John Grimes. Bishop Carroll of Nueva Segovia, P. I., resigned and returned to parish work in Philadelphia.

The 400th anniversary of the creation of the diocese of San Juan, Porto Rico, the senior diocese of all America, was commemorated (August). During this period it has had 51 bishops, the present one being Bishop Jones, formerly of Philadelphia, Pa.

CONGRESSES AND MEETINGS. The twenty-third international euc-artist Congress drew to Vienna (September 12-15) more than a hundred thousand visitors. Cardinal von Rossum was the Pope's delegate, and three other cardinals and 4000 prelates and priests from all over the world attended. The grand procession at the close, in spite of a downpour of rain, was participated in by the venerable Emperor Francis Joseph of Austria, the nobility and clergy. The first week of September also, the third convention of the International Federation of Catholic Women met in Vienna, 24 nations being represented. The social conditions of women, their betterment, and the religious education of children were among the chief topics of discussion.

The third national Catholic Congress was held at Norwich, England (August 2-5), and was marked by the distinct advance in boldness with which the social and religious Home Missions, Women's League, trade conditions, and other topics were treated. It was the first general meeting of bishops, clergy, and laity since the division of England into three ecclesiastical provinces and the establishment of the archdioceses of Liverpool and Manchester.

ROPES, WILLIAM LADD. An American librarian, died October 14, 1912. He was born in Newton, Mass., in 1825, and graduated from Harvard College in 1846. He taught for several years in the public Latin School of Boston, and was then ordained to the Congregational ministry. From 1863 to 1862 he was pastor of the first church at Wrentham, Mass. From 1866 to 1905 he was librarian at the Andover Theological Seminary. In the latter year he retired and was appointed librarian emeritus.

ROTCH, ABBOTT LAWRENCE. An American

meteorologist, died April 5, 1912. He was born in Boston in 1861 and was educated in private schools in Boston and in European cities. In 1884 he received the degree of S. B. from the Massachusetts Institute of Technology. He established in 1885 the Blue Hill Meteorological Observatory near Boston, which became famous for investigations of the clouds and for the use of kites to record meteorological data. From 1896 to the time of his death he was professor of meteorology at Harvard University. Professor Rotch observed the three solar eclipses of 1887, 1889, and 1893 for meteorological purposes. The first of these was in Russia, the second in California, and the third in Chile. He was a member of several international commissions and congresses and was decorated by various foreign universities and governments. In 1905-6 he collaborated with Teisserenc de Bort in sending a steam yacht to explore the tropical atmosphere. He also took part in several scientific expeditions in the United States, South America, Europe, and Africa. From 1886 to 1896 he was associate editor of the *American Meteorological Journal*. He delivered lectures before the Lowell Institute of Boston in 1891 and 1898. He was librarian of the American Academy of Arts and Sciences. Among his published works are: *Sounding the Ocean of Air* (1900); *The Conquest of the Air* (1909). He also edited *Observations and Investigations at Blue Hill*, published since 1887 in the *Annals of the Harvard College Observatory*. Numerous articles were contributed by him to scientific journals.

ROUSSEAU BI-CENTENARY. See FRENCH LITERATURE.

ROWING. Cornell still reigns supreme in the college rowing world, having made a clean sweep of the races in the intercollegiate regatta held on the Hudson River, near Poughkeepsie. Cornell also defeated Harvard and Princeton in a two-mile race on the Charles River. In the intercollegiate regatta Cornell scored its fourth consecutive victory in the 'varsity eight oars and also won the four-oared and freshmen eight-oared events. Wisconsin finished second in the 'varsity eight oars, Columbia third, Syracuse fourth, and Pennsylvania fifth. Leland Stanford University which, for the first time, took part in the regatta, had to be content with last place.

The Cornell 'varsity eight consisted of C. H. Elliott, bow; E. S. Bates, 2; B. A. Lunn, 3; W. O. Kruse, 4; G. B. Wakely, 5; B. C. Spransy, 6; C. B. Ferguson, 7, and W. G. Distler, stroke. With one exception the make-up of the crew was the same as in 1911. The winner's time for the four miles was 19 minutes, 31% seconds. The record for the event, 18 minutes, 53% seconds, was made by Cornell in 1901. The times of the other crews in 1912 were: Wisconsin, 19:35%; Columbia, 19:41; Syracuse, 19:47; Pennsylvania, 19:55, and Stanford, 20:25. In the 'varsity four-oared event (2 miles) Cornell's time was 10:34%; Columbia's, 10:41%; Syracuse's, 10:58%, and Pennsylvania's, 11:23%. The winning four included C. W. Brown, bow; G. P. McNear, 2; L. Chapman, 3, and E. L. Dole, stroke. Cornell, also the winner of the freshman eight oars, covered the two miles in 9 minutes 31% seconds. Wisconsin was second in 9:35%; Syracuse third in 9:42%; Pennsylvania fourth in 9:46%, and Columbia last in 9:47. The winning eight

were E. Ornelas, bow; S. V. Hiscox, 2; E. L. Pollard, 3; L. F. Cramer, 4; E. S. Craft, 5; W. W. Butts, 6; J. E. O'Brien, 7, and W. V. Ellms, stroke.

Harvard for the fifth year in succession was triumphant over Yale in the annual races held on the Thames River, near New London. The Cambridge oarsmen made a clean sweep of the three events for the third time since 1909. Harvard's time in the 'varsity eight-oared event was 21 minutes 43% seconds and Yale's 22 minutes 4 seconds. The winning eight comprised G. H. Balch, bow; M. Eager, 2; Q. Reynolds, 3; A. M. Goodale, 4; L. H. Mills, 5; A. Strong, Jr., 6; G. P. Metcalf, 7, and G. F. Nettleton, stroke. In the 'varsity four oars Harvard's time was 11 minutes, 24 seconds and Yale's 11 minutes, 55 seconds. The winning four included G. F. Stratton, bow; F. H. Trumbull, 2; E. D. Morgan, 3, and L. S. Chanler, stroke. The most exciting race was that between the freshmen eights, the Harvard crew's time, 10:52, being only 2% seconds better than Yale's, 10:54%.

In the Pacific Coast intercollegiate 'varsity race over a three mile course, Leland Stanford finished first, Washington second, and California third. The winner's time was 16 minutes, 10 seconds. Stanford also won the freshman event over a two-mile course with California second. In dual college regattas the United States Naval Academy defeated Pennsylvania, and Syracuse defeated the Naval Academy.

The Canadian oarsmen carried off the laurels at the fortieth annual regatta of the National Association of Amateur Oarsmen held at Peoria, Ill., by winning eight of the ten most important events. The Winnipeg Rowing Club triumphed in the crew races, capturing the senior eight-oared shells, senior four-oared shells, and the senior international four-oared shells. H. H. Phinney of the Winnieps won the intermediate single sculls, while Phinney and Punshen captured the intermediate double sculls event. The senior single sculls went to A. F. Culver of the Winnieps. E. B. Butler of the Argonaut Rowing Club of Toronto, repeated his victories of 1911, by winning both senior sculls championships at 1% miles and the % mile dash. The only important events won by the United States oarsmen were the intermediate four-oared shells and the intermediate eight-oared shells. The four oars were won by the Grand Rapids Boat and Canoe Club and the eight oars by the Duluth Boat Club, whose crew established a new world's record by rowing the 1% miles in 6 minutes, 16 seconds. The old record was 6:19%.

The tenth annual regatta of the National Rowing Association, popularly known as the American Henley, was held on the Schuylkill River, over a course of 1 mile, 550 yards. The winners of the main events were: First four-oared shells, Puritan Cup, University Barge Club of Philadelphia; first eight-oared shells, Columbia University Rowing Club; junior collegiate eight-oared shells, New England Cup, Harvard; first four-oared sculls, Union Boat Club of Boston; first single sculls, Farragut Cup, Walter Stokes of the University Barge Club.

At the Henley regatta, held on the Thames, England, the Sydney Rowing Club of New South Wales won the Grand Challenge Cup.

Eton College, for the second successive year, captured the Ladies Challenge Plate. New College, Oxford, won the Steward's Challenge Cup. The sixty-ninth annual Oxford-Cambridge regatta was won for the fourth successive year by Oxford in the slow time of 22 minutes, 3 seconds. The record for the event, 18:29, was made by Oxford in 1911. R. Arnst of New Zealand, who won the world's professional sculling championship in 1908, lost his title to Ernest Barry in a 4¼-mile race on the Thames, England.

RUBBER. Much attention was aroused in 1912 by the discussion of practical methods for the production of synthetic or artificial rubber, as is fully discussed below. Whether the synthetic product would enter into competition with the native material was, of course, a matter of speculation and opinions differed, some holding that, as in the case of artificial indigo, the plantation supply would be seriously cut into, while others believed that with practically an unlimited territory in the tropics available for cultivation, improved methods of rubber culture in which due economy was considered, would be fully able to insure an ample supply, the processes of nature, all things being considered, being the most economical.

The constantly increasing use of rubber is shown in the statistics of production and consumption. These figures, as compiled by Arthur Lampard, chairman of the Rubber Plantations Investment Trust in December, 1912, give the following estimates of the world's production and consumption in 1912:

PRODUCTION

	December Estimate
	Tons
South America (East Coast).....	40,700
South America (West Coast).....	2,000
Central America and Mexico.....	5,000
Africa	15,000
Assam, Rangoon, and Borneo.....	2,500
Guayule and Jelutong rubber.....	10,000
Plantation	28,500
All other sources.....	1,000
Total tons.....	104,700

CONSUMPTION

	December Estimate
	Tons
America	48,000
Great Britain	17,250
Germany	16,000
France	10,000
Russia	7,000
Belgium	2,000
Other countries.....	8,000
Total tons.....	108,250

During the year the visible supply of rubber at the markets of the world constantly decreased, and it was stated that the United States alone was able to absorb the entire world's supply of this material. This fact accounts for the conclusion reached in the above table that the year's consumption, 108,250 tons, was 3550 tons in excess of the production for

the year. It is of interest to note that the supply of plantation rubber is constantly increasing and Mr. Lampard estimated that in 1913 this amount would increase from 28,500 tons to 40,000 tons.

In Hawaii during the year there were under cultivation about 1500 acres of rubber, of which 1200 acres were planted in Ceara and 300 in Hevea. The principal part of the industry is controlled by five large companies operating with local capital, whose names and acreage are given in the accompanying table:

	Estab- lished.	Rubber acre- age planted Capital. (approx.)
Nahiku Rubber Co.....	1905	\$150,000 480
Hawaii American Co....	1905	50,000 245
Koolan Rubber Co.....	1906	30,000 275
Nahiku Sugar Co.....	1906 250
Pacific Development Co.	1907	80,000 250
Total		1,500

The organized planting was begun in 1905, and the best results have been found where the trees have been carefully cultivated. The trees are tapped when about two years of age and in 1912 some 50,000 trees were tapped. The preference of the growers is in favor of Ceara rubber, though large experimental plantations of Hevea rubber have been made.

As further illustrating the wonderful increase in the consumption of rubber the official estimates of the State of Pará which are compiled annually show that the world's production in 1895 amounted to 58,277 tons, of which the Amazon region furnished 20,700 tons and Africa, Central America, and Malaysia, 37,577 tons. By 1911 this amount had increased to 88,000 tons, of which the Amazon districts supplied 42,800 tons, and Africa, Central America, and Malaysia, 32,980 tons, and Indian plantations, which only began to figure in statistics at the beginning of the century, had reached 12,220 tons.

The Pará government estimate of the production of Amazonian rubber for the calendar year 1911, from the various republics and districts, follows:

	Tons.
Federal Territory	10,580
State of Amazonas.....	10,420
State of Pará.....	10,300
Republic of Bolivia.....	2,950
Republic of Peru.....	2,490
State of Matto Grosso.....	2,100
Republic of Venezuela.....	50
Republic of Colombia.....	30
* States of Ceara, Bahia, Maranhao.....	3,900
Total	42,820

* Also including Manicoba, Mangabeira, and Soria. The exports of rubber from South America show that New York is the chief destination for the product and that Pará is the leading port of export. The figures of shipments for the year ending June 30, are as follows:

Shipments from	'10-11 Tons.	'11-12 Tons.	Shipped to	'10-11 Tons.	'11-12 Tons.
Para	14,972	21,577	New York.....	13,596	20,613
Manaos	16,142	16,664	Liverpool.....	16,522	15,529
Iquitos	2,372	2,498	Hamburg.....	777	690
Itaquatiara. 108	166		Havre.....	2,615	3,914
			Antwerp.....	84	155
			Vigo.....	...	4
Total.....	33,594	40,905	Total.....	33,594	40,905

SUMMARY OF NEW YORK RUBBER PRICES FOR 1912

Afloat from Pará to Europe, December 31	1,379	720	1,080	

An India Rubber Exposition was held at the Grand Central Palace in New York City from September 23 to October 3, 1912, and in addition to exhibits showing the various stages of the industry from the raw material to the many finished products, a conference was held at which a number of important technical papers were presented by the various delegates, many of whom came from abroad.

The annual sales of manufactures of rubber in the United States in 1912 were estimated at \$225,000,000 to \$250,000,000, of which pneumatic tires took some \$100,000,000. In the early part of the year it was proposed to place an import tax on raw rubber on the ground that it would be effective in producing revenue and that it would concern principally automobile tires used by the wealthy. Little definite, however, was heard of this proposal, which many thought was injudicious. In the calendar year 1912 the imports of unmanufactured India rubber into the United States were valued at \$111,158,015 as compared with \$87,941,338 in 1911 and \$110,408,359 in 1910. The imports of manufactured India rubber amounted in 1912 to \$1,177,680 as compared with \$867,629 in 1911, and \$1,050,875 in 1910. The total exports of India rubber manufactures in 1912 were valued at \$13,540,835 as against \$12,701,202 in 1911 and \$11,224,936 in 1910. See AGRICULTURE and for Putumayo Atrocities PERU, History.

RUBBER, SYNTHESIS OF. Chemists, conscious of the possibility of reproducing by laboratory methods products similar to natural compounds, as shown by the successful synthesis of alizarin in 1869, and indigo in 1880, have sought, since the increasing demand for rubber and the decreasing sources of supply in recent years, to build up a synthetical rubber. Chemists in Germany and in England have made reports from time to time (see YEAR BOOKS for 1910, p. 153, and for 1911, p. 166) concerning their progress in obtaining the desired product, but it was not until June 17, 1912, that Dr. W. H. Perkin, of Manchester, at a meeting in London of the Society of Chemical Industry, made the definite announcement of his success in obtaining the much-sought after product. Earlier investigators, notably W. A. Tilden, of England, and G. Bourchatard, of France, had clearly pointed out that isoprene, an oily volatile hydrocarbon that may be obtained from oil of turpentine,

was the important ingredient of rubber. This isoprene under given conditions was converted into a substance analogous to caoutchouc. The problem, therefore, was to derive isoprene from abundant raw materials and then to effect its conversion into rubber through the medium of plentiful and cheap reagents. Dr. Perkin in studying these problems associated with him Dr. E. Fernbach of the Pasteur Institute, Dr. F. E. Matthews, and others. A cheap source of isoprene was sought, and coal, petroleum, wood, sugar, and starch were considered. Starch may be converted into acetone or fusel oil by fermentation. These substances can then readily be converted into isoprene. Fernbach found a germ capable of changing the starch into the ingredients mentioned, thus solving the first part of the problem. Isoprene when brought into contact with metallic sodium, according to Matthews, became converted into solid rubber. In consequence of these two discoveries, Dr. Perkin announced that "there can now be no doubt that rubber may actually be obtained synthetically by the polymerization of isoprene, and its homologues, and that the synthetic product is really rubber and strictly comparable with natural rubber."

Meanwhile, at the great Farbenfabriken-Bayer Company of Elberfeld, in Germany, the process had been worked out along similar lines, using coal as a starting point and polymerizing the resulting isoprene by heat. Dr. Carl Duisberg, president of the Elberfeld plant, showed at a meeting of the Congress of Applied Chemistry, held in New York in September, two synthetic rubber automobile tires, made in his works, which had run over 4000 miles. He said: "The stone is rolling and we will see to it that it reaches its destination. The end in view is this, that artificial rubber may soon play as important a role in the markets of the world as does natural rubber. Synthetic rubber, let me say, will surely not appear on the market in the immediate future."

So far as is known, the German synthetic rubber has met all of the exacting tests and analyses of other German chemists. On the other hand, it is said that the English artificial rubber is not chemically identical in its atomic makeup with natural caoutchouc, and the critics declare that this artificial substitute will not meet all of the requirements. As is usual with new products, much work both in the laboratory and in the factory will have to be done before synthetic rubber can be placed on the market, but Perkin in his lecture claimed that the new rubber could be produced at 60 cents a pound, as against \$1.35, the price given by him as that of Pará rubber. The "synthetic rubber scare" over the possibility of successfully marketing the artificial product seriously depressed rubber shares in England and almost precipitated a panic, but it was soon shown that the increasing rate of demand, the reduced plantation output, as well as the possible future of synthetic rubber, were sufficient to counteract any disastrous results. At the third international rubber and allied trades exhibition, held in New York in September, Dr. L. E. Weber said: "By the time the synthetic chemists will achieve what they are after—and they will achieve it in time, we have absolutely no doubt—the output of plantation rubber will be so great and the cost of

plantation rubber will have been so reduced, that synthetic rubber can't meet the figures."

Announcement is made that a factory has been established at Gmuiden, at the mouth of the North Sea Canal, to produce artificial rubber. The process is secret, but the principal ingredient is said to be fresh sea fish. According to report, 15 to 16 per cent. of natural rubber is added to the fish, and the result is a substance as flexible and elastic as rubber, but much cheaper. This artificial rubber can be vulcanized in a short time, is benzine-proof, and can resist the effect of heat.

Meanwhile factories for the reclaiming of rubber are increasing both in this country and abroad. No ideal process has as yet been discovered, but essentially the treatment involves the following steps: (1) The grinding of the waste rubber; (2) its solution in some solvent, such as naphtha or xylol; (3) heating for the liberation of the sulphur used in vulcanization; (4) the separation from the solution of mineral and other insoluble ingredients; (5) the separation of the rubber by precipitation, as with alcohol, or by filtration, leaving the rubber on the filter.

See *The Production and Polymerization of Butadiene, Isoprene and Their Homologues*, by W. H. Perkin, *Journ. Soc. Chem. Industry*, vol. 31, p. 616, July 15, 1912. Recent books are: *The Chemistry of the Rubber Industry*, by Harold E. Potts, and *Rubber, Its Production and Industrial Uses*, by P. Schidrowitz.

RUBBER, WORLD'S PRODUCTION OF. See AGRICULTURE.

RUM. See LIQUORS.

RUMANIA. A European constitutional monarchy, bordering on the Black Sea and composed of the former principalities of Moldavia and Wallachia, with the territory of the Dobruja. Bucharest is the capital.

AREA AND POPULATION. Area of the 32 districts which compose the kingdom, 131,353 square kilometers (50,715 square miles). Population (estimated at end of 1911), 7,086,796. Marriages (1911), 74,542; births, 290,870; deaths, 179,076; still-births (not included in the foregoing), 8144; excess of births over deaths, 120,794. Population (1911) of Bucharest, 295,213; Jassy, 79,680; Galatz, 66,507; Braila, 60,901; Ploeshti, 49,256; Craiova, 45,780.

EDUCATION. In spite of progress, educational facilities remain inadequate. Primary instruction is technically compulsory between the ages of 7 and 14. Although improvement has been made, nearly 60 per cent. of the population are returned as illiterate. Secondary schools are well attended; special schools are mainly agricultural. There are universities at Bucharest and Jassy. The religion of the country is the Greek Orthodox.

PRODUCTION. Agriculture is the leading industry, and has progressed notably in the last forty years. In 1866 (the first year of the present reign), the area under sown crops was but 2,230,000 hectares; while in 1906 it was 5,520,000 hectares. Forests cover 17.5 per cent. of the total area, 7.8 per cent. is under pasture, 3.8 under natural grasses, 1.4 under orchards, 46.1 under sown crops and fallow—representing 76.6 per cent. of the total area of the kingdom. In a year of good crops the value of the entire agricultural output is approximately nine hundred million lei; in a year of excellent

crops, over a billion. The country amply feeds itself and is able to export grain and fruits and vegetables in great quantities.

Wheat has shown the greatest increase, in 1866 about 238,360 metric tons, valued at 54,892,000 lei, having been exported, as compared with 1,716,000 tons, valued at 251,342,000 lei, in 1905. Viniculture has declined by reason of the phylloxera ravages, but replanting is proceeding rapidly. Plum orchards cover about 72,000 hectares; counting an average of 600 trees per hectare, this gives a total of 43,000,000 trees. In the following table are seen areas devoted to main crops and yield for 1911 and 1912, with the yield per hectare in 1911:

	Hectares		Quintals		Qa.
	1911	1912	1911	1912	ha.
Wht.	1,930,164	2,069,420	26,033,561	24,334,331	13.5

Tobacco	9,992	9,284	93,030	9.3

* Seed. † For sugar. ‡ Hectoliters.

The cultivation of forage plants, formerly extensive, has declined with the cattle-raising industry—an industry which has steadily lost ground since the closing, in 1882, of the Austro-Hungarian frontier to the export of live animals. While during the year 1866-7 the export of cattle alone was between forty and sixty thousand head, it had fallen, in 1882, to two thousand. The only class of livestock whose numbers have increased since 1866, is horses; cattle have remained stationary, sheep have not gained materially; and hogs, of which 178,000 head were exported in 1881, are raised only in sufficient numbers to supply the country's own needs.

On the other hand, the fishing industry has grown. In place of the large importation common in former years, there is now an annual export valued at about 2,790,000 lei. The state forests yield an average revenue of 30,000,000 lei. In 1886 the petroleum output was 5370 tons; in 1905, 682,000; in 1910, 1,352,300. In 1905 the export of crude petroleum was 52,000 tons; of refined, 120,000; of mineral oils, 90,000; of benzine, 49,000. The total export in 1910 of petroleum and bitumens was 586,151 tons, valued at 38,807,169 lei; of which France took 140,150 tons (13,105,317 lei) and the United Kingdom 125,687 (6,619,839).

COMMERCE. Trade for four years is shown below in lei (1 lu=19.3 cents):

	1907	1908	1909	1910
Imps.	430,590,115	414,058,479	368,300,099	409,715,576
Exps.	554,018,631	379,430,871	465,056,619	616,504,872

The chief imports (1910) were metals, minerals, and their manufactures, 98,972,000 lei; vegetable fibre textiles, etc., 66,185,000; machinery, 30,219,000; wool, hair, and their manufactures, 36,246,000; silk and its manufactures, 14,982,000; skins, etc., 14,920,000; vehicles 11,289,000; drugs and chemicals, 8,279,000; building stone, etc., 5,194,000; glassware, 4,870,000; clocks and watches, 3,170,000.

The largest export was cereals and cereal de-

rivatives, 489,821,008 lei in 1910, compared with 357,587,891 lei in 1909 (3,230,235 tons against 2,187,763 tons). Of these the most important are shown for 1910 compared with 1909, in thousands of lei:

Exports	1909	1910	Exports	1909	1910
Wheat..	178,402	329,619	Rye.....	8,872	16,015
Corn....	102,716	69,597	Flour.....	6,504	12,509
Barley..	37,442	41,185	Millet.....	1,729	1,679
Oats....	20,338	17,041	Bran.....	1,189	1,482

Petroleum export, 38,897,169 lei (36,268,546 lei in 1909), of which 17,694,368 refined petroleum, 16,676,140 benzine, 3,696,105 crude petroleum and residue—in tons, 337,036, 126,334, and 118,931.

Legumes, seeds, flowers, and parts of plants, 34,730,967 lei, of which 21,700,078 lei oil seeds, 10,784,983 peas and beans, 897,002 other seeds, 609,529 tobacco. Wood and timber, 25,192,207 lei (29,445,651 lei in 1909). Live animals, only 2,693,475 lei in 1909, rose to 5,951,725 in 1910, the principal customers being Russia (4,666,946 lei) and Italy (776,560). Animal foods, 4,826,201 lei (5,782,356 in 1909), of which 3,428,813 lei eggs, the remainder fish.

Countries of origin and destination (1910 trade) follow, values in millions of lei:

	Imps.	Exps.		Imps.	Exps.
Germany....	138.2	24.3	Russia.....	11.8	6.3
Aus.-Hun...	98.1	37.3	Switzerland..	8.5	...
U. K.....	56.8	33.5	Netherlands.	5.8	99.1
France.....	25.6	46.9	Egypt.....	.2	8.8
Italy.....	21.7	68.7	Gibraltar....	...	31.7
Belgium....	14.1	226.2	Other.....	15.3	9.7
Turkey.....	13.9	19.0	Total	409.7	616.5

Vessels entered (1911), 37,985, of 11,707,631 tons; cleared, 37,849, of 11,739,333. Merchant marine, January 1, 1912: 96 steamers, of 22,202 tons; sailing, 497, of 150,739.

COMMUNICATIONS. In 1876 the tonnage transported by rail was 574,000, in 1905, 6,723,000; passengers carried (1876), 742,000 and 6,590,000 in 1905. The 916 kilometers in operation in 1876 earned 12,800,000 lei and the expenditure was 10,000,000 (excess of revenue over expenditure, 3032 lei per kilometer); in 1905 the 3179 kilometers in operation earned 71,000,000 lei and expended 37,500,000 (10,516 per km.). In operation September 1, 1912, 3690 kilometers, of which 3473 kilometers were state-owned. State telegraph lines (1911), 7321 kilometers; wires, 20,841.

FINANCE. The budget for 1912-13 is given in detail below:

Revenue	1000 lei	Expenditure	1000 lei
Public service....	133,429	Finance	207,017
Indirect taxes....	85,100	Public works....	95,828
Monopolies	72,360	War	74,428
Finance	69,946	Instruction	48,219
Direct taxes....	49,280	Interior	47,417
Stamps, etc.....	29,461	Justice	11,029

Other	Extraordinary....	5,100
Total	505,647	Total	505,647
1910-11 †	583,358	1910-11 †	524,709

* Justice, 1,868,000; industry and commerce, 1,496,000; war, 536,780; foreign affairs, 180,000; agriculture and domains, 138,000; public works, 34,6000. † Actual revenue and expenditure.

1912—40

The public debt stood April 1, 1912, at 1,565,954,115.

ARMY. The reorganization of the Rumanian army based on the budgetary law of 1911-12 and previous legislation came into effect on October 1, 1912. This organization was considered advanced and effective, and resulted in greater centralization. The plan of organization included a central administrative bureau which included the general staff and 5 army corps and 5 reserve divisions. The infantry consisted of 9 rifle battalions, of which 32 are divided into 2 battalions of 4 companies and 8 into 3 battalions of 4 companies each, with an equal number of reserve battalions. The cavalry consisted of 1 regiment of Royal Guards divided into 3 active squadrons and 1 depot squadron, 10 regiments of Roshiori, each consisting of 4 active squadrons and 1 depot squadron, 10 regiments of Calarashi, each of 4 active squadrons and 1 depot squadron, the latter being formed from the old Schimbul, a form of militia which was being eliminated under the new law. The artillery consisted of 20 regiments of field artillery of 6 batteries each, and 4 horse batteries, and 2 regiments of fortress artillery. The engineers included 5 battalions of pioneers, each comprising 3 companies, and 1 telegraph company, 3 companies of fortress pioneers, 4 companies of pontoon troops with 1 depot company, 4 active companies of railway troops with 1 depot company, an aeronautic section, and other technical troops. The annual recruit contingent in Rumania was about 28,000 men out of 100,000 who reach the age of eligibility, when they are liable to 7 years' service in the regular army and first reserve. The peace strength of the army consisted of about 70,000 men, but on a war basis this could be raised to 200,000, with 13,200 cavalry, and 496 guns, with 100,000 trained men still available to make good the losses in the field. The Rumanian army was well trained and its participation in any general Balkan movement would have been important.

NAVY. The effective fleet included (1912), one protected cruiser (date of 1888), of 1320 tons, 1 dispatch boat (130 tons), 5 gunboats (607), 1 training ship (350), 1 torpedo depot (104), 3 gunboats date of 1882 (135), 4 torpedo gunboats (128), 3 torpedo boats (150), 4 police boats (2720), 8 torpedo vedettes (360)—in all, 31 vessels of 6004 aggregate tons; besides police launches, etc.

GOVERNMENT. The executive authority is vested in a king, assisted by a council of eight members. A senate and a chamber of deputies compose the legislative body. Reigning sovereign (1912), Charles I., born April 20, 1839, elected to the principship in 1866, crowned king May 10, 1881. The ministry as constituted October 14, 1912, was composed as follows: T. Maiorescu, premier and minister for foreign affairs; Al. Marghiloman, finance; T. Jonesco, interior; C. G. Dissesco, worship and instruction; N. Filipesco, agriculture and domains; M. G. Cantacuzene, justice; Al. Badarau, public works; Gen. C. Herjeu, war; N. Xenopol, commerce and industry.

HISTORY. On April 10, M. Carp, premier and minister of finance, resigned office and the minister of war and minister of public works laid down their offices at the same time. The premier's resignation was attributed to the hostility of the Opposition, who alleged that the

methods of the government were unconstitutional. The new government was formed under M. Titu Maiorescu, who was foreign minister in the Carp government and who retained that portfolio. The November elections gave the new Conservative Democratic party under the leadership of M. Take Jonesco the preponderance in the Chamber, and the ministry was re-constituted to provide for its proper representation.

RURAL SCHOOL SUPERVISION. See **EDUCATION.**

RUSSIA. A vast empire that includes a large part of eastern Europe and northern Asia; it extends from the Baltic to the Bering seas and from central Europe and Asia to the Arctic Ocean. St. Petersburg is the capital.

AREA AND POPULATION. The first Russian census was taken January 28, 1897. The results of that census and the population as calculated January 1, 1910, together with the area, exclusive of the great internal waters, in square versts (1 sq. verst=439,408 sq. mile), are shown below:

	Sq versts	1897	1910
Europ'n Russia	4,238,711.7	94,215,400	118,690,600
Poland	111,554.2	9,455,900	12,129,200
Caucasus	412,310.8	9,248,700	11,735,100
Siberia	10,940,644.7	5,699,000	8,220,100
Central Asia	3,110,623.7	5,724,700	9,973,400
Finland	286,041.8	2,555,500	3,030,400

Total 19,099,886.9* 126,896,200 163,778,800

* 8,392,643 square miles.

As calculated for January, 1911, the total population was 167,003,400, distributed as follows: European Russia, 120,588,000; Poland, 12,467,300; Caucasus, 12,037,200; Siberia, 8,710,200; Central Asia, 10,107,300; Finland, 3,084,400.

The density for the empire (1910) is 8.5 per sq. verst. The Polish provinces are the most densely populated, Piotrkov having 179.6 to the sq. verst; Siberia is the most sparsely populated, Yakoutsk having but 0.1. In European Russia, Podolia (101.4) has the greatest and Arkhangel (0.6) the fewest inhabitants per sq. verst; in the Caucasus, Koutais (53.5) and the Black Sea government (17.2); in Siberia, Tomsk (4.3) and Yakoutsk (0.1), and Kamchatka has but 0.03; in Central Asia, Samarkand (19.3) and Zacaspan (0.8). The urban population is placed at 22,506,800, and the rural at 141,272,000. Slavs (including Great, Little, and White Russians, Poles, etc.) form 91.8 per cent. of the population of the empire; Letts and Lithuanians, 3.1. The Kalmuks of the Astrakhan steppes are Mongols. Tatar tribes inhabit southern Siberia. The Cartvelian tribes form 14.5 per cent. of the entire population of the Caucasus, and Turko-Tatars 20.2 per cent. Cossacks are found only in the Cossack provinces—Don, Orenburg, Amur, etc. To the Orthodox Greek Catholic Church belong 69.90 per cent. (Russians, Rumanians, most Cartvelians, some Turko-Tatars) of the total population; to Islam, 10.83 (most Turko-Tatars, and the mountain tribes of the Caucasus); to the Roman Catholic Church, 8.91 (Poles and Lithuanians); Finns, Germans, and some Lithuanians are Protestants, and the Armenians belong to

the Gregorian Church. Jews constitute 4.05 per cent. of the total. Divided according to social status, 771 per 1000 of the inhabitants are peasants, 107 burgessees, 15 nobles, 5 clergy, 5 privileged merchants, etc.; Cossacks, members of wild tribes, gypsies, etc., make up the remainder.

POPULATION of St Petersburg (1910), 1,907,708; Moscow, 1,481,240; Warsaw, 855,900; Odessa, 478,900; Kiev, 446,800; Lodz, 395,670; Riga, 324,720; Kharkov, 219,600; Saratov, 198,600; Baku,* 217,900; Vilna, 186,200; Tashkent*, 192,000; Rostov-on-Don, 121,300; Ekaterinoslav, 148,870; Astrakhan, 149,630; Kazan, 167,400; Tula, 133,700; Kishinev, 118,010; Samara, 120,980; Irkutsk,* 85,860; Minsk, 109,300; Vladivostsk*, 90,160; Orenburg, 91,240; Tomsk*, 105,620; Nizhni-Novgorod, 103,860; Nikolayev, 95,400; Kokand,* 112,800; Namangan,* 85,500; Dvinsk, 80,310; Orusk,* 90,200; Elisavetgrad, 75,480. The cities marked with an asterisk are in Asiatic Russia. In 1862 there were but five cities (St. Petersburg, Moscow, Warsaw, Odessa, and Riga) with over 100,000 inhabitants; there are now thirty-two.

The birth rate and the death rate are high. In the period 1901-5 the number of births averaged 47.6 per thousand of the population; deaths, 31.0. The marriages averaged 8.7 per thousand.

EMIGRATION. Many emigrants abroad escape from Russia without passports, and their number can be calculated only approximately from the immigration returns of other countries. Far the greater number go to the United States. Jews average about half the emigrants; next in order are Poles, Germans, Letts and Lithuanians, and Finns. Few Russians properly so-called emigrate.

Figures for the migration into Siberia are incomplete. The figures which follow are given by the board of emigration. During the period 1896-1910, emigrating peasants (into Asia) numbered 2,920,626; the forerunners (men who preceded the colonists to search out sites) numbered 696,367—total, 3,616,993. In 1910 the emigrants numbered 316,163, the forerunners 36,787, and the total, 352,950. The year 1908 shows the largest number: 664,777 emigrants, 94,035 forerunners—total, 758,812; 1909, with a total of 707,463, is not far behind. In each case the exodus was due to bad crop years in European Russia; 1910, on the contrary, shows a great decrease, due to a favorable season. Poltava and Chernigov stand first and second among the governments from which the emigrants originate.

EDUCATION. Primary education is in the hands of the minister of public instruction and of the holy synod, and to the holy synod is entrusted the expenditure of a large part of the appropriation devoted to education. Instruction is totally inadequate, and in many of the rural districts nominal only; while many of the teachers are without proper qualification. The total primary attendance in 1911 was said to be only 6,000,000 for the empire. These remarks are not applicable to Finland, which has an admirable school system, with which, however, the Russian government seems disposed to interfere.

There are secondary schools in the central districts; special schools are few and inferior. The universities have a total attendance of about 41,000.

AGRICULTURE. In the table below are given (official) figures for the distribution of agricultural lands (1909), in dessiatines (1 dessiatine=2.7 acres) by great divisions:

	Under crops	Pasture	Forest
Europ. Russia*	74,880,300	23,549,600	139,543,700
Poland	5,163,700	867,700	2,177,200
Caucasus	7,546,300	1,953,100	4,967,200†
Siberia	5,273,600	5,568,500	228,189,100†
Central Asia	1,733,600	2,597,900	15,370,700†

* Fifty governments. † Forests administered by the forestry department.

Little attention having been paid by timber-exploiting companies to that part of their contract requiring replantation of depleted areas, and the government being negligent or unable to enforce its demands, the profitable forests have declined (from 1887 to 1905) from four to thirty-five per cent. in the various governments. The net profits (1907) from the forests of the various parts of the empire, as given in the preceding table, are as follows: European Russia, 40,906,000 roubles; Poland, 6,010,000; Caucasus, 218,000; Siberia, 983,000; Central Asia 164,000—total, 48,281,000.

In the following table are given areas under main crops and production for two years (1912 preliminary), with production per hectare in 1911:

	1000 hectares		Quintals		Qs. ha.
	1911	1912	1911	1912	
Wheat <i>a</i>	25,786	24,512	121,663,868	169,763,320	4.7
" <i>b</i>	4,092	4,342	17,000,067	28,105,429	4.2
Rye <i>a</i>	28,666	28,468	188,568,891	256,802,204	6.6
" <i>b</i>	974	1,046	5,000,250	8,401,538	5.1
Barley <i>a</i>	11,367	11,351	88,001,794	99,263,950	7.7
" <i>b</i>	353	334	2,181,926	2,683,611	6.2
Oats <i>a</i>	17,241	16,581	115,086,443	141,096,204	6.7
" <i>b</i>	2,015	1,947	9,508,251	13,862,784	4.7
Corn <i>a</i>	1,593	1,645	20,810,834	20,221,350	13.1
" <i>b</i>	9	9	91,648	86,816	10.1
Flax <i>1a</i>	1,388	1,403	5,218,375	3.8
" <i>2a</i>	4,688,315	3.4
" <i>1b</i>	225,244	2.3
" <i>2b</i>	113	92	220,475	1.9
Beets *	779	753	130,127,016	89,589,955	167.1

a European Russia (63 govts.). *b* Asiatic Russia (10 govts.). Flax 1, seed (production); 2, fibre. * For sugar (empire).

The sugar-beet production for 1912 is final; preliminary figures gave 131,755,820 quintals, but frost destroyed part of the crop.

A telegraphic dispatch from the Russian government gives final figures for production of winter cereals for 1912, in Russia in Europe (63 govts.) and 24 Asiatic governments and provinces. To these in the table below are added the preliminary figures for spring cereals (63 European and 10 Asiatic govts.), and the resulting totals:

	Wheat	Rye	Barley
Europe 1.....	66,340,863	255,698,981	819,023
" 2.....	103,354,478	1,156,624	98,375,965
Total	169,695,341	256,855,605	99,194,988
Asia 1.....	9,500,667	6,879,793	2,293,264
" 2.....	27,985,197	1,960,413	2,678,697
Total	37,485,864	8,840,206	4,971,961

1—winter grain. 2—spring grain.

The 1911 agricultural year was considered a bad season, the results at harvest not fulfilling

early estimates; final figures for 1912 show much better results, and the autumn sown grains promised well for 1913, being, in October, in better than the normal average condition.

The following (unofficial) figures are given for production (1910) for other than the great cereal crops (63 European and 10 Asiatic govts.): 1,207,870 tons buckwheat, 2,596,740 tons millet, 35,729,700 tons potatoes.

Official returns for livestock, giving number on July 1, 1912, compared with July 1, 1911, show a notable decrease of all classes:

	Europe *		Asia †	
	1911	1912	1911	1912
Horses	24,795,151	23,860,178	7,194,538	6,865,878
Cattle	37,317,182	34,547,348	8,319,074	7,381,247
Sheep and goats	45,988,702	42,735,567	17,165,204	16,257,736
Swine	12,422,966	11,944,568	1,132,537	918,634

* 63 govts. † 10 govts.

For notes in regard to drainage of lands see DRAINAGE.

MINING AND METALS. The average annual coal output is estimated at 24,200,000 tons. The import of foreign coal and coke into Russia in 1910 was 4,652,666 metric tons. Coal mined in 1910, 24,409,585 metric tons. From the Donetz basin (a region in Ekaterinoslav, covering about 16,000 sq. miles) comes a large proportion of Russia's coal—12,697,700 tons in 1910; it is mostly consumed by the railways, iron works, sugar refineries, etc. Poland has an output of over 5½ million tons. A poor quality of coal is abundant in Siberia, which is nearly all locally consumed. Other important producing regions include the Urals, the Eskibastus district south of Omsk, the Kousnetski basin (Tomsk), and the Tkvioulski district (Caucasus). A new field has been discovered about eighty miles north of Rostov-on-Don, near Alexander-Grush-evski. In Russian Sakhalin the coal fields are worked by convicts.

In 1910, 22,000 tons of copper were raised (in 1909, 18,180; 1908, 16,550), the principal producing regions being the Urals, Caucasus, Siberia and the Altai mountains.

Gold (mainly derived from alluvial deposits in the Urals and Siberia) was reported at 48,723 kilos for 1909; asbestos (1910), 10,936 tons; iron (1909), 2,622,419 tons; salt, 2,264,699. Petroleum output 1910, 9,193,458 tons; 1909, 8,435,072. Output (1910) of cast iron, 184,600,000 poods; pig-iron, 185,595,000; T-beams and sleepers, 11,800,000; heavy rails, 30,000,000; assorted iron, 63,400,000; roof iron, 22,900,000. The iron syndicate (Prodamet) was dissolved automatically January 14, 1912, and was expected to be renewed for another three years.

MANUFACTURES. Cottons are manufactured, chiefly in Poland; other manufactures are flax and silk, sugar, tobacco, hemp, paper, flour, furniture, etc. Distilling is a government monopoly. Agricultural machinery is now made on a large scale, and peasant industries (wood carving, metal working, etc.), are important. Prohibitive impost duties protect the manufacturer, but the high cost of fuel and inadequate transportation facilities are at present insurmountable obstacles to the proper development of home industries.

FISHERIES. Total catch 1911, 708,000 tons,

valued at more than 97,000,000 roubles. The fish carried westward on the Siberian Railway are consumed principally in the Ural, Perm, and Zlatoust districts. The inland seas and lakes and the great rivers are practically inexhaustible sources.

COMMERCE. In the table below is shown the total external trade of the empire for four successive years, in thousands of roubles (1 rouble = 51.5 cents).

	1907	1908	1909	1910
Imps.: mdse...	847,365	912,659	906,336	1,084,446
p. m.*	10,937	28,226	46,284	71,281
Exps.: mdse...	1,053,010	998,250	1,427,675	1,449,085
p. m.*	13,108	18,914	26,806	32,158

* Precious metals.

The countries of origin and destination in the total trade of the empire are given below, with value of trade for two years in thousands of roubles:

	Imports		Exports	
	1909	1910	1909	1910
Germany	363,263	449,794	387,119	390,640
United Kingdom	127,946	153,847	288,885	315,476
China	74,607	78,813	21,782	20,168
U. S.	57,854	74,441	11,496	9,489
France	49,547	60,972	89,061	93,646
Persia	31,579	36,702	32,302	37,904
Finland	32,974	35,992	51,802	42,821
Aus.-Hun.	27,315	35,026	60,875	49,785
Netherlands	18,068	20,444	189,198	195,982
Italy	12,060	16,916	67,785	75,196
Turkey	8,824	10,836	27,682	27,859
Egypt	9,979	10,144	3,129	3,310
Denmark	7,936	7,719	36,728	26,534
Sweden	7,620	7,615	11,033	8,907
Belgium	6,726	7,093	64,392	66,515
Norway	8,798	6,522	8,092	6,184
Rumania	1,892	2,312	15,783	15,049
Greece	780	1,587	16,554	18,331
Spain	1,323	444	4,466	7,007
Other	57,245	67,227	39,521	38,382
Empire	906,336	1,084,446	1,427,675	1,449,085

The principal articles of import for consumption and of export of domestic produce follow, for 1910, with values in thousands of roubles:

Imports	1000 r.	Exports	1000 r.
Cotton	129,608	Cereals & flour	723,273
Machinery	113,996	Timber	138,205
Tea	59,444	Flax and tow	73,908
Woolens	54,365	Eggs	63,694
Metal mfrs.	47,151	Butter	51,294
Rubber	39,871	Seeds	36,759
Coal and coke	34,067	Oil cake	31,562
Metals	30,403	Live animals	30,120
Silks	28,685	Petroleum, etc.	29,723
Fish	28,157	Sugar	25,930
Paper, etc.	23,447	Cotton textiles	25,159
Hides*	23,153	Bran	24,679
Woolen yarn	22,669	Metals	19,978
Plants and seeds	21,292	Hides and skins	17,938
Chemical prods.	20,313	Hemp and tow	11,539

* Prepared; in addition, raw hides to the value of 16,988,000 roubles were imported.

Nearly all the exports show some advance over the preceding year; both were exceptionally good harvest years, and exports increased from 998,250,000 in 1908 to 1,427,675,000 in 1909. Imports declined slightly from 912,659,000 roubles in 1908 to 906,336,000 in 1909; and increased materially in 1910, owing partly to the increased purchasing power of the peasants, due to the exceptionally good harvest, and partly to increased prices.

The tables which follow relate to the trade passing by way of the European and Black Sea (Caucasus) frontiers and to and from Finland.

Trade by great classes, values in thousands of roubles:

	Imports		Exports	
	1910	1911	1910	1911
Foodstuffs	121,430	134,134	907,203	988,547
Raw materials*	515,918	517,046	430,357	473,486
Animals	3,068	3,437	22,808	25,831
Manufactures	312,124	368,062	23,507	25,873
Total	952,540	1,022,699	1,383,875	1,513,737

* Including half raw.

The cereal export in 1910 was much greater in quantity than in 1909 (847,084,000 poods, against 760,746,000), but the total value was somewhat less. The principal details of the cereal export are given below:

	1000 poods		1000 roubles	
	1909	1910	1909	1910
Wheat	314,259	374,560	384,173	405,170
Rye	35,499	40,527	34,130	29,867
Barley	219,159	244,578	165,868	158,445
Oats	74,652	83,904	61,750	63,665
Corn	41,142	27,417	31,143	19,164
Wheat flour	5,369	6,186	10,488	11,481
Rye flour	6,933	5,474	7,663	5,672
Bran	38,976	37,337	26,501	24,500

The principal articles of export across the Asiatic frontier are sugar and cotton goods; imports, rice and raw cotton.

SHIPPING. Vessels and tonnage entered and cleared in the total foreign trade of the empire (1910) are shown in the following table:

Ports	Entered		Cleared	
	No.	Tons	No.	Tons
White Sea	1,130	830,000	1,079	828,000
Baltic	7,446	5,547,000	7,525	5,629,000
Black and Azov	5,335	7,554,000	5,220	7,425,000
Pacific Coast	672	955,000	635	879,000
Total	14,583	14,886,000	14,459	14,761,000

Merchant marine, January 1, 1912: White Sea, 476 vessels, of 34,916 tons (net); Baltic, 957, of 186,086; Black and Azov, 1249, of 269,471; Pacific Ocean, 38, of 22,049; Caspian Sea, 811, of 229,380—total, 3531 vessels, of 742,802 tons.

COMMUNICATIONS. Total railways in operation January 1, 1912, 69,432 versts (74,061 kilometers), of which 15,957 versts in Asiatic Russia, and in European Russia 53,475 (35,075 state, 16,273 private, and 2128 local).

During the year ending June, 1912, the department for railways and the commission under the finance ministry for the construction of new railways considered sixty-nine new railway projects, which comprised an aggregate of 14,855 versts (about 9860 miles), entailing an expenditure of more than 1000 millions of roubles (about \$500,000,000). Nine projects had been approved by the commission, but not further advanced; while three schemes had met with the disapproval of the commission, and five were disapproved of by the ministerial council. For one project—the Bui-Rybinsk Railway at the middle of the year—the decision of the ministry had not been reached; for two projects—the Orsk-Troizk and the Mohilev-Ljgov schemes

—the authorities considered further survey necessary, and two, it was held, should be built for state reasons. Of the remaining thirty-nine projects which had been laid before the ministerial council, two—the Kazan-Ekaterinburg and the Nizhni-Novgorod-Kotelnitch—had still to be laid before the second department of the council of state, while the other thirty-seven schemes had already been passed by this department. These thirty-seven railway projects referred to an aggregate length of 5418 versts (3600 miles), the calculated aggregate cost being 389,318,000 roubles.

A railway which extends the Koltshuginsk-Barnaul-Pavlodar line for the Altai district, in southern Siberia, has been approved by the Russian government. This new line will enable coal from the Koltshuginsk coal mines, which, while containing millions of tons of the finest coal, had been shut down for several years, to be shipped for the Altai Railway to those parts of the Altai district, where fuel is lacking on account of the absence of forests.

Total telegraph lines (1910), 203,077 kilometers; wires, 714,220. Post offices, 15,701.

FINANCE. The standard of value is gold, and the monetary unit the rouble, par value 51.456 cents. Revenue and expenditure, ordinary and extraordinary, have been as follows, in roubles (1912 budget):

	1910	1911	1912
Rev. ord....	2,780,987,000	2,951,782,684	2,896,519,261
" extraord.	24,249,000	2,567,906	105,400,000
Total	2,805,236,000	2,954,350,590	3,001,919,261
Exp. ord....	2,473,157,000	2,535,995,758	2,669,941,806
" extraord	123,593,000	309,694,698	331,977,455
Total	2,596,660,000	2,845,690,456	3,001,919,261

The foregoing figures are compared with those of earlier years as follows, in thousands of roubles: 1909, revenue 2,689,085 (2,526,341 ordinary and 162,744 extraordinary), expenditure 2,607,452 (2,451,424 and 156,028); 1906, revenue, 3,355,781 (2,271,670 and 1,084,111), expenditure 3,212,697 (2,061,134 and 1,151,563); 1901, revenue 1,963,373 (1,799,457 and 163,916), expenditure 1,874,257 (1,604,887 and 209,370).

Sources of estimated revenue and items of estimated expenditure as shown in the budget for 1912, are given in the table in the adjoining column. Included in the estimated revenue from state property is 646,154,695 roubles from railways, while the "various" revenue includes annuities from railway companies 18,113,472 roubles. The ordinary expenditure for public debt includes 375,661,670 roubles interest, 27,893,326 amortization, and 966,550 exchange; for finance, 100,729,481 roubles pensions, etc., and 195,461,647 sale of spirits; for interior, 69,247,121 roubles posts, telegraphs, and telephones, and 59,410,459 police.

The public debt amounted to 9,014,141,796 roubles on January 1, 1911, and 8,941,640,620 roubles on January 1, 1912.

ARMY. The reorganization of the Russian army as a result of the war with Japan had been practically effected by 1912, and three new army corps formed in European Russia—one in the Caucasus and two in Siberia and the Far East—were practically organized. This made 27 army corps in Europe, 3 in the Caucasus, 2 in Turkestan, and 5 in Siberia and the

Far East, forming virtually independent armies which might be termed the European, the Caucasian, the Turkestan, and the Amur forces, divided into thirteen greater military districts exclusive of the Transcaspian region and the territory of the Don Cossacks.

Figures for the peace strength of the Russian army were mainly estimates and varied between 1,200,000 and 1,400,000 men, including some 60,000 in Turkestan and Semirjetschenk and 280,000 in Siberia, or in round numbers a million men in Europe and the Caucasus and the remainder in Asiatic Russia. The total mobilizable strength on a war basis was estimated at 5,400,000 men.

Each male inhabitant is liable for personal service between the 21st and 43d years and the annual quota of recruits available is about 1,300,000 men (1,308,712 in 1910), from whom an annual contingent of about 457,000 is voted. Less than this number (435,283 in 1910) were actually embodied in the ranks. The recruits joining the active army serve three years in the infantry and artillery and five years in the other arms, then pass into the reserve for thirteen years, and finally conclude their service in the opol'tchenié, or militia. The reserve and the opol'tchenié are also filled from those not required for service with the colors. The Cossacks, who are an important element in the Russian army, have special service liability, which begins with the 18th year and involves three years spent in local service and then twelve years spent either with the colors in the first ban or with the second or third bans, which are on unlimited leave. The Cossacks on a peace basis number over 50,000, which in time of war could be increased threefold.

The training of officers and men has improved greatly since the Japanese war and a large aviation corps has been formed.

NAVY. On December 1, 1912, the number and displacement of warships, built and building, of 1500 or more tons, and of torpedo craft of 50 tons and over, were as follows: 7 battleships (dreadnought type), having a main battery of all big guns (11 inches or more in calibre), of 158,450 aggregate tons—all building; 8 battleships (predreadnought type) with main bat-

teries of more than one calibre, of 112,050 tons, built; 2 coast-defense vessels, of 10,380 tons, built; 6 armored cruisers (63,500 tons) built; 9 cruisers (52,845) built; 98 torpedo-boat destroyers (39,375) built, and 9 (9450) building; 14 torpedo boats (2132) built; 31 submarines (6648) built, and 8 (4377) building. Total vessels built, 168, of 286,930 tons; building, 24, of 172,277—in all, 192, of 459,207 tons. Excluded from the foregoing are ships over twenty years old, unless reconstructed and re-armed within five years; torpedo craft over fifteen years old; transports, colliers, repair ships, torpedo depot ships, or other auxiliaries. Number of men voted for 1911, 46,655.

Four of the dreadnoughts reported as building are for the Baltic fleet (the *Sevastopol*, the *Petropavlovsk*, the *Gangut*, and the *Poltava*); three are for the Black Sea (the *Emperor Alexander III.*, the *Empress Marie*, and the *Yekaterina*). A programme in accord with the bill of July, 1911, was sanctioned by the Duma June 19, 1912. (See below under *History*.) An expenditure of 502,000,000 roubles was voted to cover this programme. Several million roubles will be required in addition for the adaptation of Sveaborg as the base of the future dreadnought fleet. See **BATTLESHIPS** and **NAVAL PROGRESS**.

GOVERNMENT. Nicholas II. succeeded Alexander III. as "emperor of all the Russias" November 1, 1894. He was born May 18, 1868. He married Princess Alix of Hesse-Darmstadt November, 1894, and was crowned at Moscow May, 1896. The health of the eight-year-old heir-apparent, Alexis, has latterly been the cause of much anxiety.

The third Duma sat from November 1, 1907, to June 21, 1912; the fourth Duma was elected September, 1912. The heads of departments were, 1912: V. N. Kokovtsov, premier and minister for finance; A. A. Makarov, interior; V. B. (Baron) Fredericksz, minister of the imperial household; S. D. Sazonov, foreign affairs; Gen. V. A. Sukhomlinov, war; Vice-Admiral I. K. Grigorovitch, marine; J. G. Stcheglovitov, justice; S. I. Timachev, commerce and industry; S. V. Rukhlov, communications; A. V. Krivocheyn, agriculture; P. A. Kharitonov, state comptroller; Dr. L. A. Casso, instruction; V. K. Sabler, procurator-general of the Holy Synod.

HISTORY

GENERAL POLITICAL SITUATION. In 1912 as the election of a fourth Duma was approaching there was much discussion of the recent political history of Russia and of the outlook for the future. Opposing views are held as to the condition of affairs since the revolution. To English-speaking readers the unfavorable view is the more familiar. It may be briefly summarized as follows: The rights wrested from autocracy in October, 1905, by the threat of revolution were either canceled or gradually reduced as soon as the fear of a popular rising was allayed. Government officials have controlled the elections in the interest of the central authorities. They have numerous ways of getting rid of an objectionable candidate, one simple and effective method being to expel him until after the election. A Duma chosen in that manner is in no sense a parliamentary assembly. The government has left it no real power. It cannot remove the ministers and if

it refuses to pass a law the government may carry it into effect during the recess of the Duma by simple decree. Autocracy and bureaucracy have little by little regained all the powers that they had for the moment lost.

The other side has recently been set forth by a French traveler in the following words: "Such criticisms are much exaggerated and very unjust. Between Russia of to-day and Russia as she was before the war with Japan, under the Von Plehve ministry, the difference is, whatever people say, enormous. Public liberties are infinitely greater; the journals say nearly what they wish; the Duma, even with its reduced prerogatives, exercises by its mere presence an appreciable influence upon the acts of public officials; parliamentary discussion is free; and the sharpest and bitterest criticism is leveled against the governors, the ministers, and sometimes even the members of the imperial family. . . . The pretended reformers of the first and second Dumas with their extreme and chimerical notions, their absolute ignorance of the mentality and the real needs of the peasants, that is to say of nine-tenths of the Russian population, led the country toward anarchy and chaos. Reforms can be made only in a slow and gradual manner. In a country so vast, peopled by millions of moujiks, who a half-century ago were still serfs, it is impossible to introduce by a single stroke the political system of England or France."

ATTITUDE TOWARD THE POLES. The Nationalist measure proposed by M. Stolypin, gave great offense to the Poles, whose opposition finally led to an important modification of it. One clause provided that the new province of Kholm established by the bill was no longer to form a part of the kingdom of Poland. An amendment rejecting this clause was passed by the House in March by a vote of 150 to 105, the government's representatives raising no objection. This action was welcomed as a sign of a more conciliatory attitude on the part of the government; but later, at the third reading, this amendment was modified. The Polish problem seemed as far from solution as ever. With the growth of Russian nationalist sentiment during the last few years it has become more acute. Throughout the kingdom of Poland proper, where the great majority are Poles, the government has not ventured on a policy of complete Russification, but though according the natives some concessions it has pursued an inconsistent and harassing course. Since 1905 instruction in the private schools may be given in Polish, but public schools remain essentially Russian and the University of Warsaw is attended mainly by Russians and Jews. Young Poles attend foreign universities, especially that of Cracow. Under the régime of Governor-General Skalone a number of Polish schools have recently been closed. As a result of this policy the number of illiterates has greatly increased. Another grievance is the fact that the promise of self-government has not been carried out to the satisfaction of the natives, who desire a Diet like that in Galicia. But the problem of Poland proper is complicated by the conflicting interests of races in the mixed zone extending between western Russia and the kingdom of Poland. Here the bulk of the population is Lithuanian, Little Russian, and White Russian, but for centuries the country had belonged to Poland, and the Polish landed aristoc-

racy, though reduced considerably under Russian rule, still held the majority of the large estates, and under the electoral system, representatives of this class were sent to the Imperial Council. The Russian nationalists objected to this Polish representation of a region whose population was mainly Russian, but they were unwilling to adopt the obvious remedy which was to establish a more democratic basis for the local representative bodies (*zemstvos*) which chose the members of the Council.

To solve the problem of suppressing the Poles without elevating the democracy, M. Stolypin had recourse to his ingenious device of national "*curias*," which went into effect in 1907. Under this system the electors are divided into two "*curias*," according to their nationality, and the Russian "*curia*" chooses the number of delegates. It is analogous to the class system employed in Prussia and elsewhere, but differs from it in aiming at the dominance of race and not of a social class. M. Stolypin's measure for placing the *zemstvos* of the western provinces on this electoral basis, though approved by the Duma, was strongly opposed in the Imperial Council, and led to the constitutional crisis of March, 1911, when, as noted in our preceding YEAR BOOK, he resorted to arbitrary means and forced it through in spite of the resistance of the upper chamber. The *zemstvos* measure was obviously designed, not for the purpose of extending the principle of self-government in those provinces, but in order to eliminate the Poles. The nationalist policy now went even further and sought to increase the territory under this system at the expense of Poland proper. In certain parts of the governments of Lublin and Siedlce the majority of the population speak Little Russian, but a good many of these Little Russians in Poland have gone back to Catholic orthodoxy since the decree of 1905 on liberty of conscience, being "*Uniates*," who down to that time had been kept from Catholic "*Union*" only by the arm of the law. Thus the race and religious questions are interwoven. To strict, conservative Russians, members of the Catholic Church in Poland are virtually Poles, and they wish to see these Little Russian "*Uniates*" brought back to Greek orthodoxy. These extremists hold that Russia can change at will the limits of Poland as fixed by the Congress of Vienna in 1815, and they have urged the formation of a new government out of these Little Russian districts with Kholm as capital, to be united with the government of Kiev or placed under the ministry of the interior. Great indignation was aroused by this plan, which was characterized as the "*fourth partition of Poland*." If the frontier was to follow strictly linguistic lines, the western part of the government of Grodno should be restored to Poland, but the nationalists had no idea of doing that. The subject was under discussion in the Duma during the early part of 1912 and an amendment refusing to separate the new Kholm government was at first carried, but later modified (March, 1912), as noted above. The question was still unsettled.

END OF THE THIRD DUMA. The third Duma came to an end on June 21, having passed the navy bill the day before. The vote on this most important measure was 228 to 71. It provided for the expenditure of 502,000,000 roubles on the building of vessels and ports between

the years 1912 and 1917. Its specific features were as follows: The construction of 4 armored cruisers, 8 small cruisers (4 for the Baltic, 2 for the Black Sea, and 2 for the Pacific station), 36 destroyers for the Baltic, and 18 submarines; the enlargement and improvement of the present naval dockyard; and the equipment of the ports of Kronstadt, Reval, Sveaborg, Sebastopol, Nicolaieff, and Vladivostok; the dreadnoughts proposed or in process of construction to have a coal capacity sufficient for service either in the North Sea or in the Mediterranean. It meant nothing less than the revival of Russia's sea power, for which various reasons were assigned, including the relations between Russia and Germany, and the danger of a foreign coalition against Russia. Other important measures passed by the Duma were laws relating to workingmen's insurance, to the reform of the local administration of justice, and to military recruiting. The czar in his prorogation speech congratulated the Duma on its passage of the navy bill and commended it for the attention it had bestowed during the last five years on questions of the highest importance, namely, the organization of peasant farming, workingmen's insurance, the care of workingmen's families, popular education, and national defense. On the other hand, he lamented the acrimony shown in debate on various occasions.

THE FOURTH DUMA. The elections for the fourth Duma began in October and were concluded early in the following month. They resulted in the complete triumph of the Right, which secured an absolute majority of seats. The electoral law of June 3, 1907, was designed to assure the preponderance of the great landed proprietors and to prevent democratic or revolutionary elements from gaining control. It allowed the government a free hand in interfering with elections. The ministry took full advantage of it in the elections for the fourth Duma. Opponents of the government accused the authorities of gross unfairness and withdrew from the contest in many districts. Under the law of 1907 the government manipulated the complex "*curia*," or electoral class system (see above paragraph) in its own interest, particularly as regards the clergy, who moreover were organized by the higher ecclesiastical authorities into an active campaigning body. The vote of ecclesiastics was made practically compulsory and in some governments nearly every member of the clergy cast a vote. On the other hand the bureaucracy did all that was possible to check the activities of the opposition by refusing to permit the publication of platforms, by prohibiting or breaking up their meetings, by exiling to another part of the empire electors suspected of holding adverse opinions, etc. The electioneering of the clergy occasioned much adverse comment not only among the parties of the Left, but among the great landed proprietors who found their own political influence menaced by it. The party that suffered the heaviest loss was the Octobrists or Liberal Conservatives, who had supported the policy of M. Stolypin, but who had offended the reactionaries by their fight for religious liberty and the preponderance of the civil authority. Their number was reduced from 132 in the third Duma to 90 in the fourth.

The fourth Duma, which met on November 28, was divided approximately as follows: Right,

60; Nationalists, or moderate Right, 125; Octobrists, 90; opposition groups, 160. M. Rodzianko, an Octobrist, was elected president.

FOREIGN AFFAIRS. The new foreign minister, M. Sazonoff, made his first speech in the Duma on April 26. He referred to the undiminished strength of the alliance with France and the entente with Great Britain and expressed hope of a reconciliation between England and Germany and a better understanding with Austria-Hungary and with Italy. Apropos of the Persian crisis he commented on the excellent effects of the Anglo-Russian understanding. He expressed the firm determination of the government to safeguard Russian interests in Mongolia and Northern Manchuria. An interview between the czar and the German emperor and their respective foreign ministers and chancellors took place at Port Baltic on July 4. These meetings have become a matter of custom, having been held in 1902, 1905, 1907, 1909, and 1910. They seem to have had no definite effect upon the general foreign policies of the two countries, although they have given rise to much speculative comment in European journals, especially in France and England. Early in August the French premier, M. Poincaré, paid a visit to the czar, which was followed by the usual expressions of renewed international amity. A supplementary naval clause to the Franco-Russian military convention was reported to have been signed on this occasion, thus completing the alliance by assuring the co-operation of the two powers on sea as well as on land. The actual text was kept secret. The interview occasioned much conjecture in the press, and many declared that Russia's ulterior motive in forming this naval convention was to secure the opening of the Dardanelles. This was emphatically denied by M. Sazonoff, who characterized M. Poincaré's visit as "a happy but normal event." On July 23 an interview took place between the czar and the king of Sweden. For further discussion of Russia's foreign relations, see PERSIA, GREAT BRITAIN, UNITED STATES, and CHINA, under *History*, and TURKEY AND THE BALKAN PEOPLES.

ARMENIAN REVOLUTIONARY TRIAL. In the spring of 1912 146 Armenians were tried on the charge of belonging to a secret society and seeking to bring about a political revolution in order to establish a Caucasian federated republic. After two months' trial, four of the 146 prisoners were sentenced to penal servitude for varying periods, 26 to exile, 21 to fortress imprisonment, and the others were acquitted.

THE LENA STRIKE. A strike of about 3000 men in the Lena gold fields region in Siberia led to a conflict with the Rural Guard April 22. As the crowd of strikers were advancing, they were ordered to stop by the captain of the rural guard, but being pressed on by those behind, were unable to do so, whereupon the troops fired and killed 190 and wounded 210 others. Public indignation was expressed at this action of the authorities, who were accused of deliberately provoking bloodshed. One Russian paper remarked that while in England a strike of 5,000,000 had not cost a single drop of blood, in Russia a strike of 3000 people cost hundreds of lives. The explanations of the ministry in reply to the criticisms of the press were not regarded as satisfactory. One of the ministers held that the movement at Lena was of a political nature, and that the troops were

obliged to fire in self-defense, and another, in contradiction to his colleague, claimed that the men's grievances were of an economic nature. One consequence of the affair was a strike of 100,000 workmen in St. Petersburg as a protest against the massacre of strikers at Lena.

ANTI-SEMITISM. The long-standing and frequently repeated charge against the Jews of ritual murder was revived in the city of Kiev in 1912 and arrests were made for the murder of a boy named Yuschinsky, which was attributed to religious motives. The authorities harbored a suspicion that a certain secret sect of the Jews were responsible for the crime, which was virtually a ritual murder. Many believed the accusations to be baseless and merely to reflect the hatred of the Jews. The hearing in the case was postponed until the autumn. In March, during a debate on the reform of the judicial administration, a motion was carried in the Imperial Council rendering Jews ineligible to the office of justice of the peace.

OTHER EVENTS. A British delegation of members of Parliament, university men, merchants, etc., visited Russia in January and received a cordial reception at St. Petersburg in the closing days of the month. King George expressed the thanks of the government and people for the cordial welcome accorded to the deputation by the Russian government and nation. In January the czar granted a pension of \$5000 a year to the widow of Tolstoy. During the summer there was evidence of revolutionary propaganda in the navy and 300 sailors of the Black Sea fleet were arrested and sent ashore for trial by court-martial. Eleven of the mutineers were shot in November. The funeral of M. Alexis Suvorin was held on August 27 amid thousands of spectators. See FINLAND.

RUST. See BOTANY.

RUTGERS COLLEGE. An institution of higher education at New Brunswick, N. J., founded in 1766. The number of students enrolled in all departments of the college in the autumn of 1912 was 510, of whom 380 were in the full courses leading to a degree and 130 in the short courses in agriculture. The faculty and instructors numbered 60. The new appointments for 1912 include Alexander James Inglis, Ph. D., professor of the science of teaching; Melville Thurston Cook, Ph. D., professor of plant pathology; and Thomas J. Headlee, Ph. D., professor of entomology. The only notable benefaction during the year was one of \$20,000 from Miss Susan Y. Lansing. The productive funds of the university amounted to \$727,000 and the income to \$288,000. The library contained 66,990 volumes. President, W. H. S. Demarest, D. D.

RYAN, THOMAS F. See PRESIDENTIAL CAMPAIGN.

EYE. The world's crop of rye in 1912 was normal in quantity and quality. While in Europe an unusually wet harvest season was injurious to the cereal crop in general, the time of harvesting and other conditions so favored the rye crop that among the cereals it sustained the least injury. Any reduction in yield in Europe was more than offset by the remarkable crop harvested in Russia, which amounted to 1,043,982,356 bushels and surpassed the yield of 1911 by 281,773,302 bushels. In France also the yield was better in 1912 than the year before, the production for the

two years being about 51,000,000 and 48,000,000 bushels, respectively. The crop of Hungary, including Croatia and Slavonia, was estimated at about 57,000,000 bushels; that of Spain, where it was the best among the cereals, at 25,755,000 bushels; of Italy at 5,285,000 bushels; of Rumania at 3,622,000 bushels; the production of Bulgaria at 12,402,000 bushels, and that of Germany at 456,608,000 bushels. The Canadian rye production in 1912 was 3,086,000 bushels, an increase of over 400,000 bushels as compared with the previous yield.

In the United States the growth of the crop after a cold winter and a late spring was favored by suitable weather and by a small margin a record crop was produced, although the acreage as compared with that of 1911 was somewhat decreased. Rye is one of the stationary crops and the area devoted to it does not change much from year to year. The production of 1912 in the United States was 35,664,000 bushels, or 2,545,000 bushels more than in the previous year. The total acreage was 2,117,000, which was 10,000 acres less than in 1911. The average yield was 16.8 bushels per acre, the highest on record. The price paid farmers on December 1, 1912, was 66.3 cents per bushel, while in 1911 on the corresponding date the price was 83.2 cents. On this basis the total value of the crop for the year was \$23,636,000, as against \$27,557,000 the year before. The leading rye-producing States and their yields were as follows: Wisconsin, 6,240,000 bushels; Minnesota, 6,026,000 bushels; Pennsylvania, 4,935,000 bushels; Michigan, 4,921,000 bushels; New York, 2,112,000 bushels, and New Jersey, 1,200,000 bushels. All other States produced less than a million bushels. The acreage and yield of Michigan have been steadily decreasing for several years. Among the leading States Minnesota ranked first in average acre-yield, with 23 bushels.

SABATIER, PAUL. See NOBEL PRIZE

SAFETY AT SEA. Largely as a result of *Titanic* disaster, the board of supervising inspectors of the Department of Commerce and Labor amended a number of the general rules and regulations under the authority conferred upon them by Congress. These regulations as amended up to September 25, 1912, received the approval of the Secretary of the Department of Commerce and Labor and thus acquired the force of law. Due provision was made for the construction and inspection of various forms of lifeboats, life-rafts, davits, and other appliances, including the equipment of lifeboats with the necessary appliances, food and distress signals, all of which were duly specified. The most important change was that providing for the number of lifeboats or life-rafts which represented an advance over previous requirements.

The new regulations provided that all ocean steamers carrying passengers must be equipped with lifeboats to accommodate at one time all persons on board, but that one-half of such equipment might be in approved life-rafts or collapsible boats. Coastwise steamers must make similar lifeboat provision for all persons on board, except in the case of vessels navigating only between May 15 and September 15, when accommodations for at least 60 per cent. of all persons on board are required. In the case of lake, bay, and sound passenger steamers the same provision holds good, except

that for summer boats 30 per cent. accommodation is demanded, and that in case the regular route lies within a distance of five miles from land or over water whose depth is not sufficient entirely to submerge the vessel in case of disaster but 10 per cent. accommodation is demanded as a minimum. For lake, bay, and sound passenger steamers navigating the waters of the lakes, bays, and sounds tributary to the Pacific coast, the Atlantic coast south of the 33rd parallel or North Latitude and the Gulf of Mexico, lifeboat accommodations for at least 30 per cent. of all persons on board is demanded, except for vessels whose routes lie at all points within five miles of land or other shallow waters, when accommodations for at least 10 per cent. is the minimum. Three-fourths of the lifeboat capacity for lake, bay, and sound steamers may be in approved life-rafts or collapsible boats. River passenger steamers must be equipped with lifeboat accommodations for at least 10 per cent. of all persons on board, three-fourths of which equipment may be in approved life-rafts or collapsible boats.

An important statute requiring efficient apparatus and at least two operators for radio-communication on ocean steamers was enacted by the Sixty-second Congress and was approved July 23, 1912. This law amended and extended previous legislation on this subject and provided "that from and after October 1, 1912, it shall be unlawful for any steamer of the United States or of any foreign country navigating the ocean or the Great Lakes and licensed to carry, or carrying, fifty or more persons, including passengers or crew or both, to leave or attempt to leave any port of the United States unless such steamer shall be equipped with an efficient apparatus for radio-communication, in good working order, capable of transmitting and receiving messages over a distance of at least one hundred miles, day or night."

The act was to go into effect on the Great Lakes on April 1, 1913, and for ocean cargo steamers on July 1, 1913. In the case of the latter it was provided that, in lieu of the second operator, "there may be substituted a member of the crew or other person who shall be duly certified and entered in the ship's log as competent to receive and understand distress calls or other usual calls indicating danger, and to aid in maintaining a constant wireless watch so far as required for the safety of life."

Another important act to harmonize the national law of salvage with the provisions of the international convention for the unification of rules, with respect to assistance and salvage at sea was also passed by the Sixty-second Congress and was approved August 1, 1912. This act provided "that the master or person in charge of a vessel shall, so far as he can do so without serious danger to his own vessel, crew, or passengers, render assistance to every person who is found at sea in danger of being lost; and if he fails to do so, he shall, upon conviction, be liable to a penalty of not exceeding one thousand dollars or imprisonment for a term not exceeding two years, or both.

"That salvors of human life, who have taken part in the services rendered on the occasion of the accident giving rise to salvage, are entitled to a fair share of the remuneration

awarded to the salvors of the vessel, her cargo, and accessories.

"That a suit for the recovery of remuneration for rendering assistance or salvage services shall not be maintainable if brought later than two years from the date when such assistance or salvage was rendered, unless the court in which the suit is brought shall be satisfied that during such period there had not been any reasonable opportunity of arresting the assisted or salvaged vessel within the jurisdiction of the court or within the territorial waters of the country in which the libellant resides or has his principal place of business."

The Sixty-second Congress also passed an act requiring a license granted by the Secretary of Commerce and Labor for the use of apparatus for radio-communication between the several States or with foreign nations, or upon vessels of the United States, and any person or corporation using or operating such apparatus in violation of this act was liable to punishment by a fine not exceeding five hundred dollars and the forfeiture of the apparatus. The act provided further for the supervision of all persons so licensed and for the use of a normal wave length that shall not exceed 600 meters, or that shall exceed 1600 meters. Every coast station shall be required to receive messages of such wave length as are required by the Berlin convention and every ship station shall with certain limitations conform to its provisions. The act specifies the various lengths and form of the wave, nature and form of the signal of distress, provides for reduced powers for ships near a government station, for the intercommunication of various stations, for the division of time between government and private stations, for various restrictions of power, for communication from ships to the nearest shore stations, for the limitation of further installation in the vicinity of government stations, and for the secrecy of messages. Penalties were provided for the violation of the various regulations and especially for the uttering or transmitting of a false signal of distress. This act, which was approved on August 13, 1912, did not apply to the Philippine Islands, and was to take effect four months from its passage.

A committee of the British Admiralty which had the question of lifeboat accommodations under consideration made a report recommending that provisions should be made for every passenger on a steamship. This was brought to the attention of Parliament and a bill to that end was introduced which, while not passed in the year 1912, was expected to be enacted in the subsequent year so that it would go into effect by March, 1913. The report of the Bulkhead committee which had to do with the revision of the Admiralty regulations for steamship construction and was expected to involve a thorough study of the subject in view of the discussion and criticism aroused by the *Titanic* disaster, was not presented up to the close of the year. See **TITANIC, LOSS OF THE.**

SAFETY COMMITTEES. See **RAILWAY ACCIDENTS.**

SAFETY ON RAILROADS. See **RAILWAY ACCIDENTS.**

ST. ANDREW, BROTHERHOOD OF. An organization for the spread of religious faith among young men of the Protestant Episcopal Church. The brotherhood is divided into senior and junior chapters. In 1912 there were 912

senior chapters and 543 junior chapters. The membership of the brotherhood is about 15,000, and the organization maintains four field secretaries. An important part of the brotherhood's work is what is known as its follow-up department. This is a bureau through rectors and parents to follow up young men who move to new places for business employment or to enter college or boarding school. In the national convention held in Chicago in 1912 there were 900 delegates present from all parts of the United States. Other meetings of importance during the year were the New England convention, the Connecticut State convention, the Tri-Diocesan convention, and the New York State convention at Albany. The twenty-eighth national convention of the brotherhood will meet in New York City August 1-5, 1913, just prior to the meeting of the general convention in that city.

ST. HELENA. An island in the south Atlantic Ocean; a British possession (47 square miles, 3477 inhabitants). The capital and only town is Jamestown (1439 inhabitants). Imports (1910), £37,350; exports, £9234; shipping entered and cleared, 172,358 tons; revenue, £9306; expenditures, £9596. Capt. H. E. S. Cordeaux, governor in 1912.

ST. KITTS (or ST. CHRISTOPHER) AND NEVIS. A presidency of the Leeward Islands (q. v.), consisting of the islands of St. Kitts, Nevis, and Anguilla, with their dependencies. Basseterre, the capital, on St. Kitts, has 8469 inhabitants; Charlestown, the principal town in Nevis, about 1500. The main industry of the islands is the production of sugar, molasses, and rum, about 17,000 acres being under sugarcane in 1910 and 5000 under cotton; 12,323 tons of sugar, 2521 puncheons of molasses, 18,489 gallons of rum, and 392,039 pounds of sea-island cotton were exported during the year. Salt also is exported.

	1907-8	1908-9	1909-10	1910-11
Imports	£180,347	£184,002	£172,220	£195,277

* Tonnage entered and cleared.

Customs revenue (1910-11), £32,408; public debt, £50,003. T. L. Roxburgh was administrator in 1912. See **LEEWARD ISLANDS.**

ST. LAWRENCE TUNNEL. See **TUNNELS.**

ST. LOUIS. See **ARCHITECTURE.**

ST. LOUIS MUNICIPAL BRIDGE. See **BRIDGES.**

ST. LUCIA. A British West Indian island; one of the Windward Islands colonies (233 square miles; 48,037 inhabitants, census of 1911.) The capital is Castries, with 8000 inhabitants; Soufrière has about 2300. The chief products are sugar, cacao, logwood, spices, rubber, and limes. The island has a much exaggerated reputation for unhealthiness and for a superabundance of reptiles.

	1907-8	1908-9	1909-10	1910-11
Imports.	£ 310,309	£289,775	£266,227	£277,208

Resident administrator in 1912, E. J. Cameron.

SAINT-PIERRE AND MIQUELON. A French colony of the southeastern coast of Newfoundland, including some smaller islands. Area, 241 square kilometers (93 square miles); population, 6482. Imports and exports (1910), 5,114,000 and 9,394,000 francs respectively. In 1910 the local budget balanced at 480,000 francs. M. Marchand was administrator in 1912.

ST. THOMAS. See SÃO THOMÉ AND PRINCEIPE.

ST. VINCENT. A British West Indian island, one of the Windward Islands colonies (140 or 150 square miles, 41,877 inhabitants). Part of the Grenadines are attached to St. Vincent. Kingstown (4300 inhabitants) is the capital. The chief products are sugar, rum, cacao, arrowroot, and cotton. The island is of volcanic origin.

	1907-8	1908-9	1909-10	1910-11

C. Gideon Murray was resident administrator in 1912.

SAKHALIN. An island off the eastern coast of Siberia (16,370 square miles and 12,000 inhabitants, administered by Russia and 13,155 square miles and 26,000 inhabitants by Japan). The Japanese territory is called Karafuto.

SALINAN INDIANS. See ANTHROPOLOGY.

SALMON, SIR NOWELL. An English admiral, died February 14, 1912. He was born in 1835 and received his early education at Marlborough. In 1847 he entered the navy. After being promoted to a lieutenancy in 1856 he served on the *Shannon*, visiting China and India. In the latter country he served with the celebrated *Shannon* Brigade, which took part in the relief of Lucknow. As the result of his bravery on this occasion he received the Victoria Cross and was promoted to the rank of commander. After promotion through various grades he became rear-admiral in 1879 and from 1882 to 1885 was commander-in-chief at the Cape of Good Hope. In 1885 he was made a vice-admiral, and on the occasion of Queen Victoria's Jubilee in 1887, a K. C. B. From 1888 to 1891 he was commander-in-chief in China. In the latter year he became admiral and in 1899 was promoted to the rank of admiral of the fleet. He retired from active service in February, 1905.

SALVADOR. A Central American republic on the Pacific coast. Capital, San Salvador.

AREA AND POPULATION. The area of Salvador, the smallest and, with the exception of Haiti, the most densely populated of the American republics, is variously stated, but a recent planimetric calculation indicates that the superficial extent is approximately 21,160 square kilometers (8170 square miles). The estimated population January 1, 1912, was 1,161,425. Although the people are largely mestizo and Indian, the republic shows a considerable degree of government stability and economic progress. In 1910 and 1911: Births, 46,866 and

49,179; deaths, 27,353 and 26,472. The larger towns include: San Salvador, about 60,000 inhabitants; Santa Ana, 50,500; San Miguel, 25,000; Ahuachapán, 20,600; Chalchuapa, 20,400; San Vicente, 20,400; Zacatecoluca, 20,000; Nueva San Salvador (Santa Tecla), 19,000.

EDUCATION. Primary instruction is free and nominally compulsory. Of the 173,495 children of school age in 1911, only 21,569 were enrolled in the public primary schools. These schools numbered 480, of which 203 were for males, 200 for females, and 83 mixed; teachers 851 (382 male). Besides a number of private schools, there are several institutions for secondary and special instruction.

PRODUCTION AND COMMERCE. In 1912, 166,000 acres were planted in coffee, the leading crop, and the estimated yield was about 70,000,000 lbs. In the past ten years the average production has been 70,530,000 and the average export 60,553,000 lbs. Other products include cacao, tobacco, indigo, rubber, sugar, and bananas. Mining is of increasing importance.

In 1910 and 1911, imports amounted to \$3,745,249 and \$5,390,370, respectively; exports, 18,245,590 and 19,779,551 pesos. The average value of the silver peso was about 40 cents in 1910 and 42.5 cents in 1911, so that in gold the export values may be placed at \$7,297,836 and \$8,406,309. Leading imports in 1911: Cotton cloth and manufactures, \$1,758,585; hardware, \$345,861; drugs and medicines, \$287,615; flour, \$263,714; boots and shoes, \$247,558; cotton yarn, \$178,139; machinery, \$108,735; wines, \$108,406. Principal exports in 1910 and 1911: Coffee, \$5,128,761 and \$5,835,439; gold in bars, \$601,319 and \$760,413; gold and silver amalgams, etc., \$167,800 and \$700,256; sugar, \$279,107 and \$391,796; indigo, \$314,843 and \$261,031; silver in bars, \$487,063 and \$160,702; balsam, \$81,120 and \$87,683. In 1911 the United States sent imports and received exports valued at \$1,924,652 and \$2,908,312; United Kingdom, \$1,644,238 and \$523,020; Germany, \$534,130 and \$1,571,042; France, \$393,991 and \$2,138,532; Italy, \$186,915 and \$438,034.

COMMUNICATIONS. At the end of 1910, 156 kilometers (97 miles) of railway were in operation. On July 6, 1912, a railway was opened to traffic between the port of La Unión and San Miguel (62 kilometers). This line connects a rich agricultural, mining, and stock-raising section with the southernmost port of the country. In 1911, there were 2573 miles of telegraph wire and 2112 miles of telephone wire. Post offices, 101.

FINANCE. The silver peso fluctuates in value; it was worth about 40 cents in 1910 and 42.5 in 1911. In the fiscal year 1910-11, revenue amounted to 13,251,626 pesos (ordinary 10,620,865, extraordinary 2,630,761); expenditure, 13,208,248. For 1911-12, estimated revenue 13,129,750 pesos, estimated expenditure 13,206,248; for 1912-13, 13,140,415 and 13,095,101 respectively. Estimated receipts, 1912-13: Import duties, 7,343,140 pesos; export duties, 1,478,000; liquor tax, 2,800,000; other, 1,519,275; total, 13,140,415. The larger estimated expenditures, 1912-13: Public debt, 3,900,000 pesos; war and marine, 2,399,690; interior, 1,590,068; fomento, 1,510,510; public instruction, 1,045,397. Public debt, as reported for December 31, 1911: Foreign, 8,039,257 pesos gold; internal, 2,627,330 pesos gold and 2,587,331 pesos silver; treasury bonds, 3,619,728 pesos silver.

ARMY. During 1912 attempts were being made to improve the organization of the army of the republic, which was maintained with a strength of about 3000 men, with 18,000 militia in addition, though all inhabitants of the republic were liable for military service. A headquarters staff was being organized under the control of the war minister. This included four sections as follows: 1. Recruiting, organization, and distribution of units, mobilization, concentration, and schemes of operation. 2. Instruction of officers, maneuvers, military schools, inspection of troops, regulation, and technical establishments. 3. Armament, clothing, equipment, regulations for carriages and animals, feeding of troops, medical service, and transport. 4. Foreign armies, geographical service, statistics, and cryptography.

GOVERNMENT. The president is elected by popular vote for four years and is assisted by a cabinet of four members. The National Assembly is a unicameral body of forty members. The president in 1912 was Manuel Enrique Araujo, who was inaugurated March 1, 1911, succeeding Gen. Fernando Figueroa; vice-president Onofre Durán.

SALVAGE. See SAFETY AT SEA.

SALVARSAN (ARSENIO-BENZOL; "606"). This interesting drug continued to excite lively discussion during 1912 and an approximate estimation of its actual value seems to have been reached. In spite of the fact that the early claims for it have not been realized; that it does not cure syphilis at a single dose; that its use is not without danger, and that recurrences take place after its exhibition, those having the greatest experience with the drug hold it in high regard. Woldovar of Vienna reported 2000 cases treated with salvarsan without a death; 7 patients, however, developed paralysis of the peroneus muscle; in about 0.5 per cent. symptoms of arsenical poisoning (diarrhœa, vomiting, nausea, dryness of the mouth, loss of appetite) occurred. Other observers have reported fatal cases. Rovant had 9 patients who developed intense headaches, or *tinnitus aurium*, one facial paralysis, and one optic neuritis after injection. Lesser reported a case of epileptiform seizures eight weeks after salvarsan treatment and found 17 similar cases in the literature. Witt records 9 cases of complications affecting the acoustic nerve, and advises expert examination of the ear before applying salvarsan in treatment. If a tendency is found to progressive otitis and catarrh, otosclerosis or acoustic neuritis, or if there is an inherited tendency to deafness, he urges careful weighing of the pros and cons before starting a treatment which may localize the relapse in this organ, even if it does not exert a toxic action on it. Similar reports embracing hundreds of cases found their way into medical literature. One observer noted two cases of actual reinfection following treatment with this drug. To obviate these disadvantages the manufacturers of salvarsan have put forward an improved product which they call neosalvarsan. See NEO-SALVARSAN.

SALVATION ARMY. According to statistics gathered by Dr. H. K. Carroll, the total number of communicants in the Salvation Army in 1912 was 26,909. The associations corresponding in other denominations to churches numbered 852. The officers corresponding to

minister, 2935. The statistics of communicants are no indication of the actual number of adherents to the body. The army is divided in the United States into 870 corps and outposts. The outdoor attendance at meetings was over 8,000,000. Over eighty hotels are conducted, accommodating over 7000 people. The army operates over one hundred industrial homes and five children's homes. The most important event in the history of the Salvation Army in 1912, was the death of its commander, William Booth (q. v.). His son, Bramwell Booth, succeeded him as the supreme authority of the organization. Evangeline Booth continued to be the head of the American branch of the army.

SAMOS. An Anatolian island; a principal tributary to the Porte in the sum of 200,000 piasters annually. Area, 468 square kilometers (181 square miles); population (October, 1902), 53,424, besides 15,000 natives of Samos residing on the Anatolian shore. Vathy (about 8000 inhabitants) is the capital. Imports (1911), 37,036,352 piasters; exports, 19,741,212 (wine, 8,595,000; tobacco, 2,875,000; leather, 2,764,000; cigarettes, 1,492,000). The receipts (budget estimate 1910) amounted to 3,651,660 piasters and the expenditure to 3,627,496. Debt, 2,570,500 piasters. Begleris Bey was named in 1912 by the Porte to be prince of Samos.

The prince-governor of Samos, Kopassis Efendi, was assassinated by a Greek in the latter part of March. Kopassis, who had been appointed governor in 1901, incurred the hostility of the Greeks in the following year by his attitude toward the popular party under Sophoulis. The trouble at that time caused the Porte to send troops to his assistance, and bloodshed resulted. The town was bombarded by Turkish warships. The popular leader, Sophoulis, fled, and after his departure he was condemned to death and his property was confiscated. The Greeks of Samos and of Greece generally, continued to bear resentment for this course, and the murder was attributed to this feeling.

SANGER, CHARLES ROBERT. An American chemist and educator, died February 24, 1912. He was born in Boston in 1860 and graduated from Harvard University in 1881. He was assistant in chemistry in that institution in 1881, 1882, and again from 1884 to 1886. From 1886 to 1892 he was professor of chemistry in the United States Military Academy and from 1892 to 1899 occupied the same chair at Washington University. In the latter year he returned to Harvard as assistant professor of chemistry.

He retained this position until 1903, when he was made professor and director of the chemical laboratory. He was a member of several chemical and other societies.

SANGSTER, MARGARET ELIZABETH (MUNSON). An American author, died June 4, 1912. She was born in New Rochelle, N. Y., in 1838 and was educated in private schools. Her first book, *Little Jennie*, was written when she was but 17 years of age. This was published by the Presbyterian Board of Education. This was followed by several books which were written for and given to the American Sunday Schools Union. In 1858 she married George Sangster. Shortly after the close of the Civil War she became one of the most popular of American poets. Her poems, *Elizabeth Aged Nine*, and *Are the Children at Home?* were read and recited all over the United States. In 1871 she became associate editor of *Hearth and Home*. She was associate editor of *Christian at Work* from 1873 to 1879 and of the *Christian Intelligencer* from 1879 to the time of her death. She was editor of *Harper's Bazaar* from 1889 to 1899 and was a staff contributor to several woman's magazines. Among her published works are: *Poems of the Household*; *Easter Bells*; *Little Knights and Ladies*; *Eleanor Lee*; *Lyrics of Love*; *Little Kingdom of Home* (1905); *Fairest Girlhood* (1906); *The Joyful Life* (1907); *From My Youth Up* (1909). The greater part of her books were written for children.

SANITATION. The continued fall of the general death rate raises an interesting question as to the part which sanitation has played in this reduction. To answer this in specific terms and in small compass is impossible, because it would first be necessary to discuss the various senses in which the word sanitation is used, and choose among them or make up a new definition; and, that done, the most careful analysis of the general death rate would not show definitely what portion of it from year to year is due to insanitary conditions and what to other causes. The one certain fact is that the death rate or that part or the United States (known as the registration area), which has trustworthy mortality records shows a steady general decrease, and the same thing is true in other civilized countries. The general death rate of New York City for 1912 (subject to slight correction), was 14.11 per 1000. Although this is slightly above the London rate of two or three years ago, it is the lowest rate ever recorded for New York and a notable decrease as compared with years not long past. Chicago, Philadelphia, Washington, and Boston had also reported reductions in the 1912 death rate over earlier years, prior to the time this **YEAR BOOK** went to press, and there was reason for believing that many other cities would soon do the same.

If we define sanitation, for present purposes, as environmental conditions subjected to human control, which conditions affect the health of man, and limit the definition still further to city conditions more or less thoroughly under municipal control, we may conclude, though the argument cannot be given here, that the chief sanitary undertakings which reduce the general death rate are housing control, water-supply, the collection and removal of sewage, supervision of the milk-supply, sanitary factory inspection, and, in some localities, the suppression or

reduction of various insect and animal pests, which serve as a vehicle of infection; such as the mosquito for malaria and yellow fever, and the rat, which carries the flea which carries the germ of the plague. Garbage collection and disposal and plumbing inspection have heretofore been classed as sanitary undertakings vitally affecting the public health, but the scientific evidence is against such an assumption, particularly as regards communicable diseases. Still, for the present, they may be classed under sanitation, like all other works of cleansing. The nearest we can as yet come to measuring the health benefits of any single one of these sanitary undertakings in terms of vital statistics would be to cite the many reductions in typhoid death rates which seem to be attributable to the introduction of sewers and to the substitution of pure for impure water; and we can also point to numerous epidemics of typhoid fever due to impure water or milk and to outbreaks of scarlet fever, diphtheria, and septic sore throat which careful investigation has charged against milk supplies. The Mills-Reincke theorem and the Hazen formula, together with studies by Sedgwick and McNutt, point also to a reduction in the general death rate coincident with marked declines in typhoid, due to improved water-supplies. Doubtless other measurable death rate reductions directly related to a single sanitary improvement might be cited, but with less certainty, for, in general, falling total death rates are due to a combination of many causes not separable and measurable, or at least not yet properly separated and measured by municipal and State agencies. It should be stated that in this discussion the work of boards of health in the location, isolation, and control of persons suffering from communicable diseases has purposely been omitted as not coming under the head of sanitation, as here used.

HOUSING, as related to health, has had comparatively little attention in the United States, beyond varying amounts of plumbing and nuisance inspection in most cities of size, and outside the work of the New York City and the New Jersey State tenement house departments (see their annual reports); and forming also private organizations, the most conspicuous of which is the National Housing Association (q. v.). In striking contrast British cities have spent millions in the construction of houses for the working classes, while in 1909 Parliament passed the notable Housing and Town Planning act, which not only gives local authorities more control over housing, but also gives the central agency, known as the local government board, control over local authorities in this and allied important respects. Reviews of municipal housing outside the act just named and also under it were published by the board in 1912.

MILK SUPPLY. The health department of New York City put in effect during 1912, regulations for grading milk into four classes, according to quality, and ordered that all milk sold should be labeled according to its grade. The Chicago health department, after one defeat and then a hard struggle in which it was backed by some other city officials, various civic associations, and at least a portion of the press, was again authorized by the city council to supervise the milk supply, after the city attorney had declared the whole milk ordinance void because the legislature had passed an act (aimed at

Chicago) prohibiting any municipality in Illinois to require that all milk sold within its limits must be from cows shown by the tuberculin test to be free from tuberculosis (see also Bulletin 13, Milwaukee Bureau of Efficiency, January 30, 1912, on the milk supply of that city, report of milk inspector of Boston, Mass., for 1911-12, and health reports of other cities).

MOSQUITO REDUCTION. Acting under new legislation several New Jersey counties created and financed mosquito committees in 1912. An appropriation of \$75,000 was granted to the Essex County commission. The county was inspected at frequent intervals, and breeding places were abated or else sprayed with oil. The board of health of Montclair, N. J., had six mosquito inspectors at work during the summer, some of whom were finally paid by the Essex County mosquito commission. Property owners were held responsible for maintaining mosquito breeding places. Mosquitoes were relatively few in the town during the season, but the experience of several years will be necessary to settle whether mosquito reduction work can be made continuously efficient where the mosquitoes are, for the most part, a pest rather than a menace to health, and where thorough work is demanded in many municipalities. That mosquitoes can be kept below the danger limit and excluded from habitations where otherwise yellow fever or malaria would prevail has been abundantly proved in various parts of the world.

WATER POLLUTION. The power of the Ohio State Board of Health to compel cities to build sewage treatment plants under the Bense act of 1908 (sec. 1249 et seq. 1, General Code of Ohio) was upheld on demurrer by the Supreme Court of Ohio, early in 1912 (see *Engineering News*, July 12, 1912; also April 9, 1908, for the act in full). A summary by Paul Hansen of responses to a letter sent to 120 engineers and sanitarians asking for their opinions on the principles which should govern water pollution was read before the Illinois Society of Engineers and Surveyors early in the year (see *Proceedings*; also "Conclusion" in *Engineering News* for May 2, 1912). At a water pollution conference held at Cleveland, Ohio, in October, 1912, Mr. Hansen carried his studies to a more specific personal though tentative conclusion. At the same meeting George C. Whipple, professor of sanitary engineering at Harvard University, presented an important committee report on "Standards of Purity for Rivers and Waterways" (*Engineering News*, October 31, 1912), in which was embodied the growing consensus of opinion among sanitary engineers that sewage disposal by dilution (discharge into water) is often permissible under proper control; that where treatment is required the standard should depend on local conditions, and that so far as water supplies are concerned reliance should be placed on water purification rather than sewage treatment. Reference to new British standards is made under **SEWAGE PURIFICATION**. (See *Sewage Pollution of Interstate and International Waters, with Special Reference to the Spread of Typhoid Fever*, by Allan T. McLoughlin: a bulletin of the U. S. Public Health and Marine Hospital Service. An earlier bulletin dealt with Lake Erie. Also *Sewage Polluted Oysters as a Cause of Typhoid Fever*, by George W. Stiles, a 1912 bulletin of the

U. S. Department of Agriculture dealing with numerous cases of typhoid among persons who partook of a banquet at Goshen, N. Y., in 1911.)

GENERAL. A great range of sanitary topics was discussed at the International Congress of Hygiene Demography held at Washington, D. C., in September, 1912, including ventilation from physiological and engineering viewpoints, cold storage, State and municipal health administration, and all or nearly all the subjects touched upon in this article. The *Transaction* of the Congress, in six volumes, will appear in 1913 (address Dr. John S. Fulton, secretary-general, Senate Annex, Washington, D. C.). Many sanitary topics were also discussed at the meeting of the American Public Health Association, held at Washington the previous week, and some at the International Congress of Applied Chemistry, held at New York City in September, 1912. See also **GARBAGE**; **SEWAGE PURIFICATION**; **SMOKE ABATEMENT**; **STREET CLEANING**, *Water Purification*; **HYGIENE**.

SANTO DOMINGO. See **DOMINICAN REPUBLIC**, and **ARBITRATION, INTERNATIONAL**.

SÃO THOMÉ AND PRINCEPE. Two islands off the coast of French Equatorial Africa, composing a Portuguese colony. Area, 939 square kilometers (363 square miles); population (1909), 68,221. Cacao is the principal product of the islands, their output constituting a large part of the world's supply. Owing, however, to foreign interferences in the matter of the prevailing system of coercion of indentured laborers, the trade fell off in 1909-10. Total imports (1909), 2,912,035 milreis; exports, 8,150,632. Revenue (1909-10), 931,429 milreis; expenditure, 703,315. M. Martins was governor in 1912.

SARAWAK. The northwestern portion of the island of Borneo; a British protectorate (about 42,000 square miles; population, about 500,000—no census has ever been taken). The capital is Kuching (25,000 inhabitants); Sibuh has a large Chinese population, mostly traders, and the Rejang River has a raft population of some 90,000. Chinese are employed in the gold mines of Paku and the Batang Lupar Residency. Gold export, 1910, 951,119 Straits Settlements dollars; 1909, 1,139,440 dollars; 1906, 1,415,470; 1903, 1,784,600. Coal output (1910), 32,073 tons. Export (1910) of timber, 25,241 dollars. Statistics below are in Straits Settlements dollars (shipping in tons entered and cleared):

	1907	1908	1909	1910
Imports	7,321,766	6,456,326	7,811,556	10,115,298
Exports	8,220,896	7,331,722	8,098,142	10,711,039 ^a
Revenue	1,441,195	1,259,482	1,346,962	1,407,360 ^b
Expenditure	1,359,274	1,243,643	1,152,737	1,263,063
Shipping	110,726	112,242	111,907	121,470

^a Manufactured gutta-percha, 1,855,773 dollars; jelatong, 1,089,274; pepper, 1,531,246; sago flour, 1,148,572; gutta-percha and rubber, 653,704; gambier, 134,149; rattans, 92,781.

^b Customs, 503,501 dollars; gambling, arrack, and pawn farms, 385,070; Dyak and Malay exemption tax, 84,979.

Rajah, Sir Charles Johnson Brooke (born 1829); acting, Charles Vyner Brooke (Rajah Muda), the heir (born 1874).

SARDIS. See **ARCHÆOLOGY**.

SASKATCHEWAN. A province of the Dominion of Canada. Area, 251,700 square miles

Population (census of June 1, 1911), 492,432, as compared with 91,279 in 1901. Regina, the capital, had 30,213 inhabitants (2249 in 1901). The province is administered by a lieutenant-governor, G. W. Brown, appointed Oct. 5, 1910. Premier in 1912, Walter Scott. See CANADA.

The general elections were a triumph for the Liberal party who secured about five-sixths of the seats in the new legislature. The chief issue in the campaign was a national one with which the provincial legislature had nothing to do, namely, "low tariff and larger markets." The Liberals appealed to the interests of the grain growers with this shibboleth, urging them to demand above all things a reduction of the customs duties and access to United States markets. Many Americans have recently settled in Saskatchewan and they appeared to be solidly against the Conservatives for their blocking of the reciprocity measure. The campaign was exceedingly bitter, the tone of the press was discreditable and intimidation, bribery, and election frauds were openly charged. The election was regarded as significant of the alignment of the two great parties on the tariff question. The Liberals contended that if the people did not stand by the Scott administration (Liberal) the Liberal party throughout Canada would take it as a sign that the issue of a low tariff and reciprocity might be given up. After the election the Liberal press throughout Canada took the stand that the widening of the markets and the removal of the taxation of foodstuffs would thenceforth be the leading issue.

SAULT SAINTE MARIE CANAL. See CANALS.

SAVINGS BANKS. Savings banks in the United States are of two classes, mutual and stock. Mutual savings banks, while less numerous, are immensely more important from the standpoint of depositors and aggregate deposits. The report of the comptroller of the currency showed that on June 14, 1912, there were in the United States 1922 savings banks with 10,010,304 depositors having aggregate deposits of \$4,451,816,000, the average deposit account being \$444.72. The average per capita deposit for the entire population was \$46.53. The number of banks and aggregate deposits nearly doubled since 1900. In that year there were 1002 with 6,107,000 depositors having \$2,449,547,000 of deposits. Even compared with 1908 the aggregate deposits showed an increase of more than 21 per cent. By geographical divisions the banks with the numbers of their depositors and the amount of deposits were as follows: New England States, 417, with 3,464,000 depositors and \$1,426,805,000 deposits; Eastern States, 244, with 4,193,000 depositors and \$2,070,306,000 deposits; Southern States, 179, with 366,000 depositors and \$84,539,000 deposits; Middle Western States, 852, with 1,206,000 depositors and \$410,778,000 deposits; Western States, 58, with 67,600 depositors and \$14,378,000 deposits; and Pacific States, 172, with 711,800 depositors and \$445,010,000 deposits. New York State alone had 140 savings banks with 3,024,000 depositors and \$1,633,495,000 deposits. Massachusetts far exceeded all other States with 193 such banks having 2,179,973 depositors and \$824,778,000 deposits. California showed aggregate deposits of nearly half those of Massachusetts; and Connecticut had savings deposits

of nearly \$300,000,000, there being only five other States, New Jersey, Pennsylvania, Maryland, Ohio, and Iowa, with more than \$100,000,000 of savings deposits.

Mutual savings banks are practically confined to the New England and Eastern States, being apparently connected with the development of manufacturing centres. Only 21 out of a total of 630 mutual savings banks were reported outside of those groups of States. The aggregate deposits of all mutual savings banks on June 14 were \$3,608,000,000; depositors numbered 7,851,000; the average deposit account was \$450.62. All the banks above credited to Massachusetts, New York, and Connecticut were mutual savings banks. The loans aggregated \$1,020,000,000, about 90 per cent. of which were secured by real estate. Their investments in bonds and other securities aggregated \$1,778,000,000, including State, county, and municipal bonds to the amount of \$733,000,000, railroad bonds of \$770,000,000, and other public service corporation bonds of \$110,000,000. Their total cash on hand was only \$16,186,000 or less than one-half of 1 per cent. of aggregate deposits. The average rate of interest paid by mutual savings banks was 3.9 per cent. Stock savings banks numbered 1292. Only 52 of these were found in New England and Eastern States; 178 were in the Southern States; 833 in Middle Western States; 58 in Western States; and 171 in Pacific States. Iowa alone had 728 and California had 131. Their loans aggregated \$669,000,000, of which somewhat more than one-half were secured by real estate, including mortgages. Their investments in bonds and other securities were \$144,877,000. Their depositors numbered 2,158,000, of whom 412,000 had commercial accounts. Their deposits aggregated \$842,897,000, of which \$178,127,000 were commercial deposits. The interest paid on deposits by stock savings banks ranged from 2.94 per cent in Wisconsin to 4.5 per cent. in New Mexico.

The table on the following page from the comptroller's Report shows the condition of all classes of savings banks of all countries at recent dates. For separate table of statistics of postal savings banks see POSTAL SAVINGS BANKS.

SAVINGS BANKS, POSTAL. See POSTAL SAVINGS BANKS.

SAVOFF, MICHAEL. A Bulgarian general who held chief command in the Bulgarian armies in the Turco-Bulgarian War. He was born in Eastern Rumelia in 1857. His early education included instruction in a Bulgarian school at Gabrovo, and for a brief period in Robert College, Constantinople. At the age of 21 he entered the military school at Sofia, and within a year he received the rank of lieutenant-general of the Eastern Rumelian army. From 1881 to 1885 he studied in the Academy of the General Staff in St. Petersburg. He returned to Philippopolis in 1885 and took part in the revolution which resulted in the union of Eastern Rumelia with Bulgaria. He first attracted general attention during the Servo-Bulgarian War, chiefly by distinguished service at Slivnitza, where he commanded the left wing of the Bulgarian forces. He received a wound in this action. He was given the order for bravery by Prince Alexander for gallantry in the field. Following the Servo-Bulgarian War General Savoff filled various military appoint-

ments which involved the reorganization of the Bulgarian army. The establishment of the present military school came under his supervision. He made radical changes in the veterinary and commissary departments and in the rearmament of the infantry and cavalry. From 1891 to 1894 the purchase of artillery, munitions of war, and other supplies was practically under his control. During these years he was minister of war under Stambouloff. His obstinacy and lack of tact brought about frequent quarrels with Stambouloff, but an open break did not take place until 1897. As a result Savoff was sent to command the garrison at Shumla. His qualities as an organizer gained for this division praise as the premier unit in the country. He was next appointed chief of the Military Academy in Sofia and here he became widely known as a teacher of military science and as a strict disciplinarian. Conditions in the army became unsatisfactory and Savoff was, for a second time, called to increase its efficiency. As minister of war in 1903 when Turkey threatened an invasion he prepared a plan of campaign which was practically the same as that carried out in 1912. It was as a result of his efficiency in organization that the Bulgarian peasants were brought from their farms to the front in so short a time as to fill the world with amazement in 1912. Through his efforts the famous military law of 1904 was passed. It has in effect transformed the entire nation into a fighting machine. For three years following the passage of the law, which is considered the crowning point of his career as a military organizer, he coped with a stupendous task. He placed the engineering troops on a sound footing, established a training school for reserve officers, and made radical changes in the armament. He is responsible for the use of the Creusot gun which proved so effective in the hands of the Bulgarian artillery. His conduct of operations in the war showed that his skill as a commander in the field was as great as his ability as an organizer and disciplinarian. See **TURKEY AND THE BALKAN PEOPLES**.

SCHREYVOGEL, CHARLES. An American artist, died January 27, 1912. He was born in New York in 1861 and was educated in the public schools of that city. He served an apprenticeship to a gold engraver, then to a die-sinker and later to a lithographer. From 1886 to 1889 he studied at Munich. Returning to the United States he devoted his talents chiefly to depicting scenes in Western life, and he shared with Frederic Remington the distinction of being the foremost American painter of such scenes. His most famous picture, perhaps, is the one entitled "My Bunkie." This obtained the Thomas B. Clarke prize in the

1912-41

National Academy of Design in 1900. He received medals at the Paris Exposition in 1900, the Buffalo Exposition in 1901 and the St. Louis Exposition in 1904. He was an associate of the National Academy of Design.

SCHWAB, GUSTAV HENRY. An American merchant and steamship official, died November 12, 1912. He was born in 1851 in New York City and was educated privately and at the Gymnasium at Stuttgart, Germany. When he was eighteen years of age he entered the mercantile business at Bremen. After spending half a year at Liverpool, England, learning English business methods, he returned to the United States and entered the office of his father's firm, Oelrichs & Company. In 1876 he was made a member of this firm, which was general agent for the North German Lloyd Steamship Company. Mr. Schwab took an active interest in municipal affairs and was chairman of the canal committee of the New York Produce Exchange. He was also chairman of the canal improvement State committee, formed by New York and Buffalo business interests in the campaign for the enlargement and improvement of the Erie Canal, which resulted in the so-called One Thousand Ton Barge Canal. He was a director and official in many important financial enterprises. Decorations for services were given him by the king of Italy and the German emperor.

SCHWEIGHOFER, FELIX. An Austrian comedian, died January, 1912. He was born at Brünn in 1842 and in early life began a mercantile career. He later became an employee on the street railroad. His tastes, however, were for the stage, and after singing for a time in opera he turned his attention to farce. His earlier appearances were on the smaller stages in Austria. He went to Vienna in 1871 and there achieved distinction. He remained for many years first at Strompfer, and afterwards at the Theater an der Wien and the Carl Theater. He was a comedian of exaggerated methods, but he was an artist in working out every detail of his characterizations. For several years before his death he had lived in retirement.

SCIENCES, NATIONAL ACADEMY OF. A society organized for the purpose of examining and investigating any subject of science or art and for making reports of such investigations at the call of the United States government. The actual expenses of such examinations and reports are paid out of an appropriation made for that purpose. The society was incorporated in 1863. Annual meetings are held each year in Washington, and autumn meetings are held in different cities of the United States. The autumn meeting in 1912 was held in Worcester, Mass., November 12-13. About fifty members were in attendance and twenty-one papers were read, nearly all of which had to do with geological or biological subjects. Among these were the following: Dr. William M. Davis, of Harvard University, read a paper entitled "Physiographic Evidence in Favor of the Sub-

sidence Theory of Coral Reefs." In this he gave arguments for the theory which was proposed many years ago by Dana, and which had received scant attention from naturalists since that time. A paper entitled "Restorations of Tertiary Mammals" was read by Dr. William B. Scott, of Princeton University. In this was given an interesting explanation of the processes of such restorations and reconstructions. Dr. Henry F. Osborn, of the American Museum of Natural History, in a paper on "The Geologic Correlation of Upper Paleolithic Faunas of Europe and America," described a recent visit to the paleolithic caverns of Italy, southern France, and Spain. In a paper entitled "On the Fertilization of the Egg of Invertebrates With Blood," Dr. Jacques Loeb, of the Rockefeller Institute, described some of the ways in which artificial parthenogenesis may be brought about. Other papers included "Cell Division and Differentiation," by Dr. Edwin G. Conklin, of Princeton University; "Heredity of Skin Color in Negro-White Crosses," by Dr. Charles B. Davenport, of the Carnegie Institution; "New Data on the Influence of Heredity and Environment Upon the Bodily Form of Man," by Dr. Franz Boas, of Columbia University; and "The Problem of the Asteroids," by Dr. Ernest W. Brown, of Yale University. Dr. Robert W. Wood, of Johns Hopkins University, contributed a paper describing some of the results obtained with the most powerful spectrograph in the world. He also read a second paper on "The Possibility of Photographing Molecules." The officers of the Academy for 1913 are as follows: President, Ira Remsen; vice-president, C. D. Wolcott; home secretary, Arnold Hague; treasurer, Whitman Cross.

SCOBELL, Sir HENRY JENNER. A British major-general, died February 1, 1912. He was born in 1859 and received his early education at Eton. After leaving this school he entered the army, joining the Scots Greys. His chief military service was performed in the Boer War where he went with his regiment as a major. He performed brilliant service as a scout and in attacks against the Boer intrenchments. He narrowly escaped death and capture in the disaster at Silikat's Nek, where a British force of 240 men was overwhelmed under De la Rey. Two months later, however, he captured Barberton. Throughout the remainder of the war he distinguished himself as a cavalry officer and was said by authorities to be one of the ablest cavalry leaders that the Boer War produced. He received rapid promotion, becoming major-general in 1903, and inspector of cavalry in 1907. He received many decorations for bravery in battle.

SCOTLAND. See GREAT BRITAIN, and CHILD LABOE.

SCOTT, FRANK HALL. An American publisher, died November 25, 1912. He was born in Terre Haute, Ind., in 1848 and was educated in the public schools of that State and in the Pennsylvania Military Academy. After finishing his education at the latter institution, he engaged in business in Indiana. He soon removed to New York and entered the business department of Scribner & Company in 1870. When *Scribner's Monthly* became the *Century Magazine* in 1881, Mr. Scott remained with it as treasurer. In 1893 he became president of the Century Company. He was prominently identified with the publishing interests

in the United States and was at one time president of the American Publishers' Association. He was also founder and former president of the Aldine Club, a club composed of those engaged in publishing and kindred pursuits. He was given the honorary degree of L. H. D. from Marietta College in 1894.

SCOTT, ROBERT FALCON. An English Antarctic explorer and naval officer, died from privation in company with three companions while returning from the South Pole on March 29, 1912.

Captain Scott was born at Outlands, Devonport, England, on June 6, 1868. After attending school at Stubbington House, Fareham, he became a naval cadet on the *Britannia* in 1881. Two years later he was appointed midshipman and served on the Cape Station, in the Channel squadron, and in the training squadron. In 1887 he became an acting sub-lieutenant. After passing his examination for the rank of lieutenant, taking a first-class certificate in four out of five subjects, he was appointed to this rank in 1889 while serving on the Pacific Station. He devoted especial attention to the study of torpedoes, and in 1891 was appointed torpedo lieutenant. After serving for a time on the *Vulcan*, a torpedo depot ship, he became a staff officer on the *Defiance*, a torpedo school ship. In 1896 he again went to sea as torpedo lieutenant of the battleship *Empress of India* and in the following year served in a similar capacity on the *Majestic*. He served on this ship for three years and in 1900 was promoted to the rank of commander. He became greatly interested in the subject of Antarctic exploration and in 1900 headed an expedition known as the National Antarctic Expedition into the regions surrounding the South Pole. He remained for four years, and on his return to England in 1904 was given a reception which was enthusiastic beyond measure. He was awarded a royal medal and a special Antarctic medal. He was promoted to the rank of captain in recognition of his services, but did not return to active service in the navy until 1906, when he was appointed flag captain on the *Victorious*. He served in this post for twelve months. In 1908 he commanded the *Essex*, which he left to become flag captain of the *Bulwark*. In March, 1909, he was appointed naval assistant to the second sea lord of the Admiralty. He was the first holder of this appointment. This was his last official position in the Admiralty. He resigned in 1909 to prepare for a second expedition to the Antarctic. This expedition was known as the British Antarctic Expedition.

Captain Scott sailed from Port Chalmers, New Zealand, on his vessel, the *Terra Nova*, on November 29, 1910, and reached his proposed headquarters near the foot of Mt. Erebus, South Victoria Land, near the end of that year. Included in his party were Dr. E. A. Wilson, zoölogist; T. J. Taylor and W. G. Thompson, geologists; G. C. Simpson, meteorologist and physicist; Lieut. H. L. Pennell, student of magnetic phenomena, and Dr. E. L. Atkinson, bacteriologist. No definite news of the results of the expedition was received until March 31, 1912 (see POLAR EXPLORATION). In December, 1912, a report was widespread that Captain Scott had discovered the South Pole. This proved erroneous and a few days later the news of the discovery of the pole by Captain Amundsen was received.

CAPTAIN ROBERT F. SCOTT, R. N.
ANTARCTIC EXPLORER, PERISHED MARCH, 1912

No particular anxiety was felt from the failure of Captain Scott to send news to the outer world, because it was well understood that no tidings of him could be expected until he was reached by the *Terra Nova*, which in the latter part of 1912 was sent to bring him and his party home. The tidings brought by the *Terra Nova* shocked the world. A message signed by Commander Evans, who was second in command of the party, told that the members of the advance party which had reached the pole on January 18, 1912, on their return had been overtaken by a blizzard and had perished. Captain Scott, Dr. Wilson, and Lieutenant Bowers died from exposure on March 29. Edgar Evans, petty officer, died on February 17 at the foot of Beardmore Glacier. His death was accelerated by concussion of the brain sustained while traveling over the rough ice some time before. Details of the death of Captain Oates were found in the statement left by Captain Scott. From this it was learned that, on March 17, Captain Oates, knowing that it would be impossible for him in his physical condition to proceed with his comrades, had deliberately walked away into the blizzard and perished. Captain Scott, Dr. Wilson, and Lieutenant Bowers were found dead in the tent, which they had erected as their last camping-place. This disaster was doubly tragic from the fact that a base of relief was only eleven miles distant.

In the meantime a relief party had been dispatched to assist the southern party commanded by Captain Scott, whose return was expected about March 10. This relief party reached One Ton Depot, which was within eleven miles of the spot at which Scott and his party perished, on March 3, and was compelled to return on March 10, owing primarily to the failing supply of food for the dogs, and also to the poor condition of the dogs after the strain of a hard season's work. Other efforts to reach the southern party were made, but these, too, failed. On October 30 a searching party organized by Surgeon Atkinson, consisting of two divisions, finally reached One Ton Camp. This was found to be in order and well provisioned. Proceeding along the road taken by Captain Scott, the tent which contained the bodies of the explorers was found on November 12.

Captain Scott had written his diary up to the day of his death. In this was found also a message to the public, and this gave the causes of the disaster. Captain Scott's statement in part is as follows: "The causes of this disaster are not due to faulty organization, but to misfortune in all risks which had to be undertaken. First, the loss of pony transport in March, 1911, obliged me to start later than I had intended and obliged the limit of stuff transported to be narrowed. Second, the weather throughout the outward journey, and especially the long gale in 83° South stopped us. Third, the soft snow in the lower reaches of the Glacier again reduced the pace. We fought these untoward events with a will and conquered; but it ate into our provisions reserve. . . . The advance party would have returned to the Glacier in fine form and with a surplus of food, but for the astonishing failure of the man whom we had least expected to fail. Seaman Edgar Evans was thought the strong man of the party, and the Beardmore Glacier is not difficult in fine weather. But on

our return we did not get a single completely fine day. This, with a sick companion, enormously increased our anxieties. . . . But all the facts above enumerated were as nothing to the surprise which awaited us on the Barrier. . . . On the summit in Lat. 85° to Lat. 86° we had minus 20 to minus 30. In Lat. 82°, 10,000 ft. lower we had minus 30 in the day and minus 47 at night pretty regularly, with a continuous head wind during our day marches. It is clear that these circumstances came on very suddenly, and our wreck is certainly due to this advent of severe weather. . . . I do not think human beings ever came through such a month as we have come through, and we should have got through in spite of the weather but for the sickening of a second companion, Captain Oates, and a shortage of fuel in our depôts for which I cannot account, and finally but for the storm which has fallen on us within 11 miles of this depôt, at which we hoped to secure the final supplies. . . . We arrived within eleven miles of our old One Ton Camp with fuel for one hot meal and food for two days. For four days we have been unable to leave the tent, a gale blowing about us. We are weak; writing is difficult; but for my own sake I do not regret this journey, which has shown that Englishmen can endure hardship, help one another and meet death with as great a fortitude as ever in the past. We took risks—we knew we took them. Things have come out against us, and therefore we have no cause for complaint, but bow to the will of Providence, determined still to do our best to the last. But if we have been willing to give our lives to this enterprise, which is for the honor of our country, I appeal to our countrymen to see that those who depend on us are properly cared for. Had we lived I should have had a tale to tell of the hardihood, endurance, and courage of my companions which would have stirred the heart of every Englishman. These rough notes and our dead bodies must tell the tale, but surely, surely, a great rich country like ours will see that those who are dependent upon us are properly provided for."

Records and diaries kept by members of the party were found in the tent. The searching party made efforts to find the body of Captain Oates, but these failed. A memorial was erected in the neighborhood of the place of his death.

SCRUGGS, WILLIAM LINDSAY. An American diplomatist and lawyer, died July 18, 1912. He was born near Knoxville, Tenn., in 1836 and was educated at Strawberry Plains College, Tenn. In 1858 he was admitted to the bar. From 1862 to 1866 he was chief editor of the *Columbus, Ga., Daily Sun*, and from 1870 to 1872 was editor of the *Atlanta News Era*. From 1872 to 1877 and again from 1882 to 1887 he was minister to Colombia. From 1878 to 1882 he was consul-general in China and was minister to Venezuela from 1889 to 1893. He was legal adviser and special agent of the Venezuelan government, charged with the settlement of the Anglo-Venezuelan boundary dispute from 1894 to 1898. He brought this case to arbitration in 1897. He was one of the founders of the Atlanta public school system. He wrote *British Aggressions in Venezuela or the Monroe Doctrine on Trial* (1894); *Official History of the Guiana. Boundary Dispute* (1895); *Lord Salisbury's Mistakes* (1896); *The Colom-*

bian and Venezuelan Republics (1905); *Evolution of American Citizenship* (1901); *Origin and Meaning of the Monroe Doctrine* (1902); *Evolution of the Fourteenth and Fifteenth Amendments*. He also contributed to historical, economic, and legal reviews.

SCULPTURE. During the early part of the year a bronze statue of Lincoln, by F. Edwin Elwell of New York, was unveiled at East Orange, N. J., and in October the Lincoln statue by Daniel Chester French was dedicated at Lincoln, Neb. The State of Massachusetts dedicated two battlefield monuments at Petersburg, Va., and at Valley Forge Park. On April 11, the State of South Carolina unveiled the first monument erected to the women of the State; it is by F. Wellington Ruckstuhl and cost \$20,000, of which \$7500 was appropriated by the State legislature and the balance by popular contribution. The Iowa State Memorial at Vicksburg, by Henry H. Kitson, was completed in May. In Potomac Park, Washington, D. C., the John Paul Jones memorial by Charles H. Niehaus, with a pedestal by Thomas Hastings of New York, was unveiled. A \$12,000 memorial was dedicated by the Elks at New Orleans in June. On September 16, the Illinois Centennial Memorial by Charles J. Mulligan was unveiled at Edwardsville, Ind. Two famous groups for the entrance to the Pennsylvania Capital at Harrisburg, the work of George Grey Barnard, were dedicated on the fifth anniversary of the State House. In celebration of the ter-centenary of Champlain's voyage, Rodin's "France" was dedicated at Lake Champlain in May, 1912.

SCULPTURE ABROAD. A bronze statue of Washington by Pompeo Coppini, the gift of American residents of the City of Mexico in commemoration of the centennial of the Mexican Republic, was unveiled February 22, 1912, in Mexico City.

The "Bourgeois de Calais," by Rodin, was erected in London, between the Tate Galleries and the Houses of Parliament. It was purchased by the National Art Collection Fund, and a replica will be erected at Calais. An important dedication in London was that of George V.'s memorial to Queen Victoria, by Sir Thomas Brock, and the architect Sir Aston Webb, R. A., which consists of a white marble shaft, surmounted by a bronze "Victory," with symbolic groups below. In Dublin, the Parnell monument, one of the last and greatest works of the American, Augustus Saint-Gaudens, was unveiled in the middle of 1912.

NECROLOGY. In the field of sculpture, the death roll includes J. Scott Hartley, secretary of the National Sculpture Society, who died at his home in New York, Dec. 6, 1912, and Mathurin Moreau, who died in Paris at the age of 91.

SEARS, CLINTON BROOKS. An American soldier, educator, and writer, died February 16, 1912. He was born in Penn Yan, N. Y., in 1844 and after attending the Ohio Wesleyan University until 1862 entered the United States Military Academy, from which he graduated in 1867. In 1862-1863 he served as a private in the 95th Ohio Infantry. At the close of the Civil War he was appointed to the United States Engineers as a second lieutenant. He was made captain in 1880 and, after various promotions, colonel in 1907. He served in the United States and Philippine Islands in constructing river and harbor works, fortifica-

tions, dams, etc. From 1876 to 1877 he was assistant professor of civil and military engineering at West Point, and until 1882 acted successively as professor of geography, history and ethics, mechanics, acoustics, and optics and astronomy in that institution. In 1891-2 he was instructor in submarine mining at the United States Engineering School. From 1901 to 1903 he was chief engineer of the Division of the Philippines. He served as a member of the Mississippi River Commission and was president of the special board to report upon the 14-foot water-way project from Chicago to the Gulf. He was retired with the rank of major-general in 1908. He was the author of numerous official reports and of *Principles of Tidal Harbor Improvements*. He also compiled a history of the Ransom Genealogy.

SECRET SOCIETIES IN HIGH SCHOOLS. See EDUCATION.

SEEBOHM, FREDERICK. An English historian, died February 5, 1912. He was born in 1833 of Quaker parentage. After attending the Quaker school at York he went to London to study law. He was called to the bar and practiced for a short time, but in 1857 went into business as a banker, settling at Hitchin, Herts. He was successful in business, but his more notable activities were along the lines of self-government and social progress. In his younger years he took an important part in the politics on the Liberal side, but dissatisfaction with the Gladstone Home Rule bill and other measures advocated by Gladstone led to his joining the free-trade wing of the Liberal-Unionist group. His chief reputation, however, comes from his writings in the field of social science. His work was of great originality and brilliancy. Among his writings are: *The Oxford Reformers*; *The Era of the Protestant Revolution*; *The English Village Community*; *The Tribal System of Wales*; and *Tribal Custom in Anglo-Saxon Law*. He received the degree of LL. D. from Edinburgh University, Litt. D. from Cambridge, and the same degree from Oxford.

SELANGOR. A state on the western shore of the Malay Peninsula; one of the protected Federated Malay States (q. v.). It has a coast line of about 125 miles and an estimated area of 3200 square miles (population 294,014). Kuala Lumpur (46,718 inhabitants, census of 1911) is the capital of the state and the administrative headquarters for the federation. Chief port, Port Swettenham (aggregate tonnage registered in 1909, 1,182,284). Import duties are levied on opium and spirits only.

Tin mining is the main industry, the output in 1909 being 49,022 piculs tin and 216,984 tin ore. Area actually under rubber in 1909, 100,637 acres; alienated for rubber cultivation at end of 1910, 225,013 acres, of which 113,114 were planted. Area (1909) under coconuts, 24,294 acres; under rice, 9112; gambier, 39,000; coffee, 10,645; pepper, 1250. The value of the tin export (1909), was 18,088,479 S. S. dollars. Area alienated for mining, 76,110 acres; Chinese miners employed, 62,-

SENEGAL. A French West African colony. Capital, Saint-Louis, with (1909) 22,093 inhabitants. Dakar (the capital of French West Africa) had 24,914; Rufisque, 12,457; Tivaouane, 3403; Thiès, 2404; Louga, 1726; Gorée, 1131. The Dakar-Saint-Louis Railway has a development of 264½ kilometers, nearly all in the Cayor region. Starting from Dakar, it runs east to Thiès (91 kms.), then north along the coast to Louga (193), then to the terminus, Saint-Louis (264). This line uniting the two chief towns of the colony was begun from a strategical, rather than a commercial, motive; but since the pacification of Cayor the region has become the principal field for peanut cultivation—one of the important industries. From Thiès a railway, having for ultimate destination Kayes, is now in operation to Guinguino. Travel into the interior is on horseback, and goods are carried by donkeys, oxen, and camels. Besides peanuts, millet, rice, corn, manioc, cotton, indigo, etc., are raised. Rubber and gums are gathered. Horses are plentiful and of good quality; camels are numerous during the dry season, but are sent north of the river by their owners (mostly Moors) for the wet season as they die in great numbers if exposed to the long rains. Cattle, goats, and sheep are raised. Minerals are found in abundance. Henri Cor was lieutenant-governor in 1912. See FRENCH WEST AFRICA.

SENSATION. See PSYCHOLOGY.

SERUM. See TYPHOID FEVER.

SERVIA. A constitutional monarchy in southern Europe—one of the Balkan states; previous to 1878 an autonomous Turkish dependency. Belgrade is the capital.

AREA AND POPULATION. The table below shows area by departments, population according to the census of December 31, 1910, population calculated December 31, 1911, and density (9111) per square kilometer:

Department	Sq. kms.	1910	1911	D.
Belgrade*	12	89,876	92,288	123
Belgrade	2,025	155,815	158,378	
Kraguyevats	2,295	189,025	192,124	84
Krayina	2,909	112,142	113,128	39
Krushevats	2,710	167,371	170,353	63
Morava	2,900	203,638	206,547	71
Nish	2,558	198,768	201,762	79
Uzhitse	3,288	146,763	149,112	45
Pirot	2,419	112,314	114,115	47
Podrinje	3,351	238,275	242,029	68
Pozharevats	4,157	259,906	262,203	63

	48,308†	2,911,701	2,957,207	61

* City. † 18,650 square miles.

According to religions the censused population was divided into Greek Catholics (2,881,220),

Roman Catholics (8435), Mohammedans (14,335), Jews (5997), Protestants (799), and other religions (915). The marriages in 1911 numbered 30,453, births 107,229, deaths 64,415. Belgrade had (1910) 89,876 inhabitants; Nish, 24,919; Kraguyevats, 18,378; Leskovats, 14,206; Pozharevats, 13,613; Shabats, 11,541; Pirot, 10,737; and Vranya, 10,487.

While primary instruction is nominally compulsory, actual attendance is less than 25 per cent. More than 80 per cent. of the adult population is illiterate. On the other hand, nearly every peasant occupies and cultivates his own freehold, varying from 10 to 30 acres, and there is practically no pauper population necessitating alms-houses.

PRODUCTION. Agriculture is practically the only industry, and stock-raising (particularly swine), the most remunerative branch. The area (1910) under main crops and the yield (1911) are reported as follows: 385,584 hectares under wheat, 4,167,000 quintals; barley, 107,523 hectares and 1,003,000 quintals; rye, 435,000 quintals; oats, 108,101 hectares and 733,000 quintals; corn, 585,226 hectares and 6,739,000 quintals; flax, 1723 hectares and (1910) 9944 quintals; vines, 35,210 hectares producing (1911) 154,000 hectoliters of wine. Plum orchards cover over 130,000 hectares and the fruit is preserved in large quantities for export as well as distilled for spirits. Livestock reported (from a German source) December 31 1910: 965,208 cattle, 3,808,815 sheep, 152,617 horses, 836,544 swine, 627,427 goats.

Worked forests cover over 135,000 hectares and unworked 167,000.

The mineral resources include coal and lignite, the output being valued in 1910 at 12,802,548 dinars. The manufactures include milling, brewing, distilling, sugar refining, carpet weaving, etc.

COMMERCE AND COMMUNICATION. Imports for consumption and exports of domestic produce follow, values in thousands of dinars (1 dinar=19.3 cents):

	Imps.	Exps.		Imps.	Exps.
Foodstuffs, etc.	22,769	103,776	Stone, etc.	1,619	132
Metals	20,304	9,657	Glass	1,520
Minerals	6,936	718	Machinery	12,350	28
Drugs, etc.	7,573	288	Other mdse.	1,041	43
Textiles, etc.	31,416	2,143	Total '11.	115,425	116,916
Hides, etc.	4,575	37	Total '10.	84,697	98,388
Luxuries	2,809	66	Total '09.	75,535	92,982
Paper	2,513	28			

Countries of origin and destination follow, with values in thousands of dinars:

	Imps.	Exps.		Imps.	Exps.
Aus.-Hun.	47,448	48,433	Belgium	2,081	6,142
Germany	31,347	28,933	Switzerl'd.	1,553	258
U. K.	9,524	87	Rumania	1,539	6,141
France	5,746	3,841	Bulgaria	697	2,802
Italy	4,861	4,394	Greece	325	110
Turkey	3,814	11,984	Bosnia	220	112
Russia	3,391	53	Other	743	17
U. S.	2,136	3,609			
			Total	115,425	116,916

Railways are lacking for the proper development of the country. At the end of 1911 there were 949 kilometers open for traffic. The Danube, the Save, and the Drina are the navigable rivers. The roads are badly in need of repair, many being nearly impassable. Telegraph lines, 4350 kilometers; wires, 8289.

FINANCE. The 1912 budget estimated the revenue at 130,764,713 dinars (31,855,698 from monopolies, 30,613,000 from direct taxes, 16,000,000 from state railways, 14,500,000 from customs, 9,001,000 from excise, 8,402,000 from fines, 5,547,485 from domains, 4,100,000 from posts and telegraphs, 5,093,365 extraordinary); expenditures, 130,764,713 (32,394,550 for the service of the debt, 29,527,571 war, 17,329,254 public works, 12,875,195 finance, 9,630,384 worship and instruction, 5,358,829 agriculture and commerce, 5,302,193 interior, 4,807,366 pensions and subventions, 4,834,542 extraordinary). The debt stood, January 1, 1912, at 663,617,000 dinars.

GOVERNMENT. The legislative authority is vested in a king assisted by a cabinet of eight responsible heads of departments. After the murder of Alexander I. (Obrenovitch) May 29, 1903 (o. s.), Peter Karageorgevitch, grandson of the celebrated Kara George and son of Alexander Karageorgevitch, was elected king (June 2, 1903 o. s.) under the name Peter I. He was born June 29, 1844 (o. s.), married (1883) Princess Zorka of Montenegro, and has two sons: George (born 1887), who was forced in 1909 to renounce his right of succession on account of incompetence and violence, and Alexander (born 1888), the heir-apparent. The Narodna-Skupschtina (160 members) is the legislative body. In November, 1912, Serbia recaptured from Turkey her old capital, Uskub.

There are three political parties, of which the Radicals and the Liberals are pro-Russian, and the Progressives, pro-Austrian.

The ministry as constituted September 12, 1912, was as follows: N. P. Pashitch, premier and minister for foreign affairs; Dr. L. Patchou, finance; S. M. Protitch, interior; Colonel Djoravitch, war; L. Jovanovitch, worship and instruction; Dr. M. Politchevitch, justice; K. Stoyanovitch, commerce, etc.; I. P. Ivanovitch, public works.

ARMY. The effect of the reorganization which had taken place in the Serbian army previous to 1912 was shown in its service in the Balkan War. The Serbian army, in which compulsory service is required from the age of 21, was maintained on a skeleton basis with an average peace strength of about 24,000 officers and men, which is increased in the summer months by about 10,000 men. In 1911 the peace establishment amounted to about 36,000. Ten years are spent enrolled in the first line, including the active army and the reserves, and then in the second and third lines of the national army, but on the average, hardly more than 6 months is spent with the colors in the case of the infantry, a somewhat greater period with the cavalry and artillery, where two years is the nominal service, and 18 months in the other branches. The organization is one of cadres which were to be filled on mobilization, the country being divided into 5 divisional areas, with headquarters at Nish, Belgrade, Valjevo, Kraguyevats, and Zayechar. Each of these should supply 8 battalions of infantry, 9 4-gun batteries, and a regiment of divisional cavalry. These 5 divisions theoretically when mobilized for war should furnish a total of 110,000 men, which number might be increased to nearly 200,000 officers and men available for the field, but without requisite experience and training. The

armament consisted of the Mauser rifle (model '90) for the first line troops, and the Berdan and a modified Mauser for the others, while modern quick-firing guns from the Schneider works had been supplied to the artillery. The results of the mobilization of the Serbian army and the part it played in the Balkan War, will be found discussed under **MILITARY PROGRESS AND TURKEY AND THE BALKAN PEOPLES**.

HISTORY. The general elections on April 15 gave the government a majority of one vote. Upon the refusal of the king to dissolve the Skupschtina the cabinet resigned, and the leader of the Young Radicals, M. Stoynovitch, was summoned by the king to form a new cabinet by a coalition of the Old and Young Radicals. M. Milanovitch, president of the council, died June 30. The ministry resigned in September and was succeeded by a cabinet consisting of Old Radicals under M. Pashitch. The main events in the history of Serbia during the year will be found treated at length under **TURKEY AND THE BALKAN PEOPLES**. See also the article on **MILITARY PROGRESS**.

SEVENTH DAY ADVENTISTS. See **ADVENTISTS**.

SEWAGE DISPOSAL, STATE CONTEST OF. See **SANITATION**.

SEWAGE PURIFICATION. Many engineers now feel that sewage treatment would be better than sewage purification to designate the various processes used to fit sewage for discharge into water where the volume of water and other conditions make it unwise to depend upon disposal by dilution alone. The facts are that but few sewage works are either designed or operated with the object of purifying sewage, as these two words are commonly understood. Purification would mean restoring the large volumes of water which convey plumbing wastes to their original state of purity. As a rule, sewage treatment works are operated to produce an effluent which will not offend the eye or nose, or give rise to objectionable deposits on the bed of the water which receives it. Rarely is an attempt made to remove all the bacteria from sewage. Where public water-supplies are endangered by this condition the sewage effluent should either be discharged into some other water or else the water should be purified before it is used. The view just outlined was set forth at length in a paper entitled "Sewage Treatment vs. Purification," read by George C. Whipple before the American Public Health Association in September, 1912 (see *Engineering News*, October 3, 1912).

A notable sewage treatment event of the year was the publication of the eighth report of the Royal Commission on Sewage Disposal (London, Eng.). The report was devoted wholly to the subject of standards for sewage treatment and to a standard for discharging sewage without treatment, in both cases for discharge into fresh water. For effluents from treatment works three standards were set up, corresponding with "complete" or a high degree of treatment, where screens, tanks and filter beds would be required, and to less complete works, where either chemical precipitation or else plain sedimentation in septic or ordinary settling tanks would suffice. The volume of diluting water was the main factor in determining each standard, and the standards themselves were the amounts of suspended

solids in the effluent and of dissolved oxygen that would be taken up by the effluent, the latter during a period of five days. For abstract of the report and for the standards see *Engineering News*, January 9, 1912.

During the year the first of three sewage treatment plants for Atlanta, Ga., was put in operation, including Imhoff tanks for sedimentation and sludge reduction and sprinkling filters for final treatment. Imhoff tanks were completed or put under construction in perhaps a half-dozen other American cities and their number was increased in Germany, where originated this modification of the Travis or Hampton tank, which is in itself a modification of the septic tank. It should be noted that none of the types of tanks mentioned are "systems" of sewage treatment, as is commonly supposed; they merely effect a partial removal of suspended solids from sewage, leaving the tank effluent subject to further treatment, if the work done by the tank is not sufficient to meet local conditions.

A large sewage testing or experiment station was built by the city of Columbus, O., late in 1912, in order to determine the means of sewage treatment best suited to the particular needs of that city. It was also announced that a sewage experiment station was to be installed by the engineering department of the University of Michigan. The Massachusetts State board of health continued its sewage treatment studies at its experiment station at Lawrence. These studies were begun in 1887. See also SANITATION.

SEX DETERMINATION. See BIOLOGY.

SEX DISTRIBUTION OF THE POPULATION OF THE UNITED STATES. The Thirteenth Census included statistics of sex distribution and the results show that in 1910, out of a total population of 91,972,266 there were 47,332,277 males and 44,639,989 females, or 106 males to every 100 females. In 1900 the per cent. was 104.4 males to every 100 females. The excess of males in the United States is due mainly to the extensive immigration, a much larger proportion of the immigrants being males than females. In the foreign-born white population there are 129.2 males to 100 females. In the native white population, however, there is also a slight excess of males, the ratio being 102.7 to 100. In the negro population the males are outnumbered by the females in the ratio of 98.9 to 100. Among the Chinese, males outnumbered females by more than 14 to 1, and among Japanese by about 7 to 1. The Indian population showed a small excess of males, 103.5 to 100 females.

The preponderance of males in the aggregate population of the United States is most marked in the Pacific and Mountain divisions (the far western States), with ratios of 129.5 and 127.9 males to 100 females respectively. The proportion of males is lowest in New England, this being the only geographic division in which there is a slight excess of females over males. There are only five States in which females outnumber males: Massachusetts, Rhode Island, Maryland, North Carolina, and South Carolina. In the decade 1900-1910 males increased more rapidly than females in the United States. The increase of the former was 21.9 per cent., and of the latter, 20.1 per cent. There was little change in the sex ratio for

the native population, but among the foreign-born whites the number of males per 100 females increased from 117.4 in 1900 to 129.2 in 1910.

IN URBAN AND RURAL COMMUNITIES. Of the aggregate urban population of Continental United States in 1910, 21,496,181 were males, and 21,127,202 females, the number of males per 100 females being 101.7. Of the aggregate rural population 25,836,096 were males and 23,512,787 females, the number of males per 100 females being 109.9. Of the 50 cities having over 100,000 inhabitants there were 28 in which the males outnumbered the females. The number of males per 100 females was the greatest in Seattle, where it was 136.2. Nashville showed the smallest proportion of males with a ratio of 89.6 per 100 females. Of the eight cities having 500,000 or more inhabitants, Baltimore had the lowest number of males per 100 females, 92.4, and Cleveland the highest, 106.6. The table below shows the proportion of male to female population in each of the States in 1910:

Division and State	Total population	Males	Females	Males to 100 fem.
United States	91,972,266	47,332,277	44,639,989	106.0
New England:				
Maine	742,371	377,052	365,319	103.2

SHAW, GEORGE BERNARD. See DRAMA.

SHEEP. See STOCK-RAISING AND MEAT PRODUCTION.

SHEEPSHANKS, JOHN. An English ecclesiastic, former bishop of Norwich, died June 3, 1912. He was born in London in 1834 and was educated in the grammar school at Coventry and at Christ's College, Cambridge. He became interested in the missionary work of the church and having been ordained as a priest, he went in 1859 to be rector of New Westminster and chaplain to the Bishop of Columbia. Here he remained for eight years and carried on efficient work among the lumbermen, miners, and agriculturists of British Columbia. Before his return to England he made a tour of the Pacific islands, China, and Siberia, studying the missionary work and the ancient religions of the countries which he visited. He returned to England in 1868 and became rector of Bilton. He afterwards served as rector in Liverpool. Here he took a practical interest in the development of middle-class schools and other educational efforts. In 1893 he was appointed by Gladstone bishop of Norwich. The appointment was in the nature of a surprise, as Bishop Sheepshanks was at that time little known throughout England. He continued in this office until 1910, when he resigned on account of ill health. Among his published writings are: *Confirmation and Unction of the Sick*; *Charge, Eucharist and Confession* (1902); *My Life in Mongolia and Siberia* (1903); and *The Pastor in His Parish* (1908).

SHELDON, GEORGE R. See PRESIDENTIAL CAMPAIGN CONTRIBUTIONS.

SHERIDANITE. See METEOROLOGY.

SHERMAN, JAMES SCHOOLCRAFT. Vice-President of the United States, died October 30, 1912. He was born in New Hartford, a suburb of Utica, N. Y., October 24, 1855. His father was General Richard U. Sherman. He was educated in the public schools of New Hartford and at Hamilton College, from which he graduated in 1878. Although his father and his two brothers were Democrats and he himself was a member of that party in his early years, he joined the Republican party when still a young man. After his graduation from college he studied law and in 1880 was admitted to the bar. He was elected to the office of mayor of Utica in 1884, the youngest man who ever held that position. In 1887 he was elected to the 50th Congress and was re-elected to serve in the 51st, 54th, 55th, 56th, 57th, 58th, 59th, and 60th Congresses. He was a delegate to the Republican national convention in 1892, and was chairman of the Republican State conventions of 1895, 1900, and 1908. In Congress he soon made an impression as a strong figure. He became a close friend of Thomas B. Reed during the latter's speakership, and presided over the House of Representatives more frequently than any other member. He was also for many years a firm friend and admirer of Theodore Roosevelt. In 1900 he was offered the office of secretary of the Senate, while he was still a member of the House of Representatives. He declined this offer and a little later President McKinley urged him to accept a post as one of the appraisers of the

port of New York. Mr. Sherman's constituents in the Oneida-Herkimer district held a mass meeting and asked him to continue to represent them in Congress. He therefore declined the President's offer. In the same year, while he was chairman of the State convention, he was for several days a close rival of Theodore Roosevelt for the nomination to the Vice-Presidency. In the autumn of 1902 he was a candidate for speaker of the House of Representatives, but when Sereno E. Payne of New York also became a candidate, Mr. Sherman withdrew.

In Congress he was identified with the conservative wing of the Republican party and with former Speaker Cannon, Congressman Dalzell of Pennsylvania, and Congressman Payne of New York, formed a group which for years practically controlled the legislative procedure of the House. He was also chairman of the Republican Congressional committee in charge of the campaign of 1906, and in this capacity originated the scheme of dollar contributions from the people. During this campaign he was obliged for the first time to make a strong fight to retain his seat in Congress. Strong opposition had been organized both within and outside the Republican party. The anti-organization men had with them Samuel Gompers of the American Federation of Labor, the United Labor party and the Independence League. In spite of this opposition he was elected by a vote of 24,027 against 19,757 for his Democratic opponent. His most important appointments while in Congress were to the chairmanship of the Indian affairs committee and as a member of the committee on rules. Certain charges made against him as to the use of his position in Congress to further his business interest were not substantiated. In 1908 Mr. Sherman received practically a unanimous nomination for the Vice-Presidency. In the struggle for the control of the Republican party in New York which occurred in 1910, Mr. Sherman broke his friendship with Theodore Roosevelt and allied himself with the latter's opponents at the Republican State convention at Saratoga. He contested with Roosevelt for the temporary chairmanship of the convention and was defeated. He received a decisive defeat in his attempt to secure the 23 delegates of his county for this convention. He failed even to carry his own ward against the Progressive element.

SHIPBUILDING. The annual report of shipbuilding in various countries compiled by Lloyd's Register and giving the tonnage of merchant ships exceeding 100 tons launched in all countries shows that the total output of the world for 1912 was 1719 merchant vessels, of 2,901,760 tons. This represents a total increase in the world's production of merchant ships of 251,629 tons; but this did not constitute a record, for 1906, when 2,919,763 tons were launched, still holds an advantage of 17,994 tons. Of the 1912 aggregate, 712 vessels were launched in the United Kingdom, representing 1,738,514 tons—practically 60 per cent. of the total. Germany ranks second with only 165 vessels, representing 375,317 tons, or a quota of 13 per cent. The United States comes third with 90,000 tons for ships built on the great lakes, making a total of 174 vessels of 284,223 tons launched during the past year. This proportion is 9.8 per cent. France takes fourth

place with 80 vessels, of 110,734 tons, a proportion of 3.8 per cent.; and Holland, with 112 vessels, of 99,439 tons, contributes 3.43 per cent. of the total; Japan, which comes next, launched 168 vessels, of 57,755 tons.

Accordingly, it is apparent that Great Britain was still preëminent in shipbuilding, and its proportion for 1912 was up to the average, though in 1911 this was 68 per cent.; while in 1907, the last year of great activity, the ratio was 58 per cent., and in 1906, 63 per cent. Germany's proportion for 1912 was 13 per cent. as compared with 9.7 per cent. in 1911; and in 1906, when also there was great activity, it was 11 per cent.; in 1904-8 it was over 10 per cent. In 1912, therefore, Germany considerably improved its relative position. In the case of the United States the proportion was considerably more than in 1911, when, however, the total was abnormally low—namely, 6½ per cent. In 1910, on the other hand, it was 17 per cent. The French total was less than in the previous years, their 3.8 per cent. for 1912 comparing with 4.75 and 4.13 per cent. in the two previous years. Holland's proportion was practically the same as in the previous year, when it was 3½ per cent., and 3.63 per cent. in 1910.

Lloyd's figures for the displacement tonnage of warships exceeding 100 tons, launched for the various navies showed that the abnormal output of 1911 was not maintained during 1912, though the total was only second to the figures then recorded. The decrease—234,240 tons—was attributable largely to Great Britain and Germany and would be regarded with some degree of satisfaction were the figures indicative of any lessening of the competition in naval strength and armaments, but an examination of the facts does not justify any such feeling of optimism. It will be noted that the total output is 174 vessels, of 534,629 tons. This makes the aggregate for 1911 and 1912 therefore over 1,300,000 tons, equal to an average of 650,000 tons, which is nearly 40 per cent. higher than the largest total for any previous year. The British proportion of the total for the two years was 30 per cent., which, against the proportion of 60 per cent. of the world's merchant tonnage

launched was thought by British naval authorities to constitute matter for reflection. The German total was 18¼ per cent., which compared with her proportion of 13 per cent. of the world's merchant shipping output. The United States added 5000 tons to the displacement of their warships launched in 1912, as compared with the previous year; France, 2000 tons; Japan, 19,000 tons; and Austria-Hungary, 29,000 tons. The British total was 58,343 tons less; the Italian total, 60,079 tons less; and the Russian total, 92,768 tons less. No significance need be attached to such increases or decreases, because the figures from year to year must fluctuate. In the case of Russia, for instance, there was greater activity in the building of warships in 1912 than in 1911, and in other states the tendency was distinctly towards increased production of warships. See BATTLESHIPS, and NAVAL PROGRESS, also tables on page 650.

SHIPBUILDING IN AMERICAN COAST YARDS. In addition to a number of warships for various nations, the American coast shipyards were filled with important vessels under construction, and with the opening of the Panama Canal increased business was looked for. The New York Shipbuilding Company at Camden, N. J., was building the steel Chinese cruiser *Fei Hung*, 322 feet length over all and 2600 gross tons' displacement, the steel first-class battleship *Moreno*, 594 feet, 7 inches over all and 27,600 gross tons' displacement, for Argentina, a steel collier 332 feet, 1 inch over all, for coast service, a steel passenger and freight steamer 442 feet, 6 inches over all for the Pacific Coast Steamship Company, a steel freight steamer 344 feet over all for the Old Dominion Steamship Company, and two steel bulk oil steamers 343 feet, 4 inches over all for the Standard Oil Company. The Maryland Steel Company at the Sparrow's Point yards, Maryland, had under construction six freight steamers, 420 feet, 2 inches over all for the American-Hawaiian Steamship Company, each of 6600 gross tonnage, and two passenger steamers 277 feet over all for the Chesapeake Steamship Company, of Baltimore, Maryland. A steel freight steamer 314 feet, 7½ inches over all was building at the Fore River yards, Quincy, Mass., for the Union Sulphur Company, as was also a steel oil steamer 436 feet over all, for the Standard Oil Company. The Newport News Shipbuilding and Dry Dock Company had under construction several large freight and passenger steamers, oil steamers, and oil barges, and at the yards on the Atlantic coast a large and varied programme of construction was under way. The Pacific shipbuilders also shared in this activity and while no very large work was reported from that coast, yet most of the plants were exceedingly active.

The large side-wheel steamer *Washington Irving*, for the Hudson River Day Line, was launched from the New York Shipbuilding Company's yard at Camden, N. J., on December 7. This vessel was to be licensed to carry 6000 passengers and was 416 feet, 6 inches in length over all, molded beam 47 feet, beam over guard 86 feet, 6 inches, depth 14 feet, 6 inches. The engines were three cylinder compound inclined type supplied with steam from four single and two double-ended Scotch boilers.

The accompanying table from Lloyd's *Register* shows the tonnage of vessels of 100 tons gross and upwards, exclusive of warships, launched in the principal countries of the world from 1908 to 1912:

Year	U. K. tons	Aus.- Hun. tons	Brit. Cols. tons	Den- mark tons	France tons	Ger- many tons	Hol- land tons	Italy tons	Japan tons	Nor- way tons	United States tons	Other c'tries tons	Totals No. tons
1908	929,669	23,502	34,181	19,172	83,429	207,777	58,604	26,864	59,725	52,839	304,543	32,981	1,405 1,833,286
1909	991,066	25,006	7,461	7,508	42,197	128,696	59,106	31,217	52,319	28,601	209,604	19,278	1,063 1,602,067
1910	1,143,169	14,304	26,343	12,154	80,751	159,303	70,945	23,019	30,215	36,931	331,318	29,401	1,277 1,957,853
1911	1,808,844	37,836	19,662	18,689	125,472	255,532	93,050	17,401	44,359	35,435	171,569	27,291	1,599 2,650,140

Western Rivers	146	3,872	28	482	14	1,245	3	1,231	191	6,880
Total	86	18,062	1149	44,820	366	57,870	5	6,496	105	155,743	19	9,486	1727	292,477

SHIPBUILDING ON THE GREAT LAKES. During 1912 the shipyards of the great lakes on both sides of the boundary had 52 vessels under construction for 1913 delivery. These included 7 bulk freighters, 3 passenger steamers, 2 package freighters, 3 oil steamers, 3 oil barges, 1 car ferry, 15 barges, 3 lighters, 9 dredges, 1 floating dry dock, 1 lighthouse tender, 1 tug, 1 tunnel launch, 1 machine boat, and 1 scow. It was worthy of note that 24 of these vessels were for salt-water service, 6 being for the Standard Oil Company and 18 for coastwise trade. The construction of vessels for coast service by the shipyards on the great lakes was showing a steady increase, and while the builders have been looking for such

business at times of reduced activity, it would seem as if the competition with the coast yards was becoming greater. The number of bulk freighters under construction showed a decrease for the year, and the 7 under construc-

tion would have a capacity of 62,000 gross tons of ore on a single trip, so that when they are completed, the carrying capacity added to the lake fleet of bulk freighters in eleven years, would have been increased by 43,298,000 tons.

The launchings on the great lakes in American yards during 1910 amounted to 35 vessels, of which 11 were bulk freighters (6 for the coast), 6 package freighters (3 for the coast), 3 oil barges for coast service, 3 passenger boats, 1 conveyor boat, 1 sand steamer, 1 oil steamer, 2 scows, 1 car ferry, 1 bridge pontoon, 1 floating dock, 1 barge, and 1 stern wheel steamer for Kootenay Lake.

During the year the Detroit Shipbuilding Company, at its Wyandotte yard, launched a large passenger steamer, built for the Cleve-

land and Buffalo Transit Company for service on the great lakes. This was the largest side-wheel steamship in the world, being 477 feet in length over all, 96 feet, 6 inches extreme

breadth over guards and 23 feet, 6 inches molded depth of hull. The engines were of 8000 horsepower and were designed to give a speed of 22 miles an hour from dock to dock. Elaborate and luxurious accommodations were arranged for passengers, of which some 6000 could be accommodated, there being a total of 510 staterooms, while 1500 tons of freight could be carried on the main deck of the vessel. The vessel was provided with a bow rudder for use in the tortuous channels at both Buffalo and Cleveland. The electric equipment, including a complete wireless plant, was exceedingly elaborate, and unusual facilities for fire protection were installed.

GREAT BRITAIN. In Great Britain there were

HAMBURG-AMERICAN LINE STEAMSHIP "IMPERATOR"
LAUNCHED 1912

1740

fewer small craft and fewer moderate-sized ships built in 1912, but a greater number of vessels between 6000 and 10,000 tons register—60, as compared with 34 in 1911. Seventeen merchant ships exceeded 10,000 tons, which was one less than in 1911, but the largest was only 18,500 tons, though several vessels of extraordinary size were being constructed for launching during 1913.

The following table (from *Engineering*, London), shows the notably large merchant steamers launched during the year in British yards:

Name	Tons	I.H.P.	Builders
White Star liner Ceramic	18,500	8,370	Harland & Wolff, Ltd., Belfast.
Canadian Pacific liners Empress of Asia and Empress of Russia	16,850	Fairfield Co., Ltd., Glasgow.
Nestor	14,500	8,000	Workman, Clark and Co., Ltd., Belfast.
Union Steamship Co. of New Zealand liner Niagara	13,500	John Brown & Co., Limited, Clydebank.
Desna, Darna and Drina	11,500	5,960	Harland and Wolff, Ltd., Belfast.
P. and O. liners Beltana and Benalla	11,120	9,000	Caird & Co., Limited, Greenock.
Spanish Transatlantic liner Reina Victoria Eugenia	10,840	11,000	Swan, Hunter and Wigham Richardson, Ltd., Newcastle.
Hawkes Bay	10,650	5,200	Workman, Clark and Co., Ltd., Belfast.
Makarini	10,624	5,200	Do. Do.
Vestris	10,494	7,000	Do. Do.
Vauban	10,421	7,000	Do. Do.
Holt liner Ixion	10,220	5,500	Scotts' Co., Limited, Greenock.
Spanish Transatlantic liner Infanta Isabel de Bourbon	10,020	11,000	Denny, Dumbarton.

The following table from *Engineering*, London, gives the aggregate shipbuilding in the United Kingdom in the year 1912, as compared with 1911:

	1912 Tons	1911 Tons
Steam tonnage*	1,924,320	1,985,184
Sailing tonnage	129,680	47,874
Totals	2,054,000	2,033,058
His Majesty's dockyards	54,230	55,600
Grand totals	2,108,230	2,088,658
Foreign-owned tonnage	471,600	400,000
Per cent. of total	22.4	20.0
Total merchant tonnage**	1,911,535	1,858,624
Per cent. of steam tonnage to total merchant tonnage	93.2	97.5
Horsepower of engines	2,271,775	2,241,500
Per cent. of all naval tonnage to merchant tonnage	10.3	13.6

* Includes warships built in private yards.

** Excludes British and foreign warships.

The above table includes vessels smaller than the 100 ton limit observed by Lloyd's *Register* and floating dry docks.

GERMANY. In 1912 Germany achieved the record total of 200 vessels of 477,742 tons. The merchant shipping output showed an increase of nearly 120,000 tons over 1911, and the total increase, reckoning all ships, was 90,265 tons, the difference being due to the smaller number of warships built. The figures, however, did not

take into account the large number of river craft launched at yards situated in inland waters. The list included the largest vessel built during the year, the *Imperator*, of about 52,000 tons, launched by the Vulcan Company at Hamburg. Five of the vessels built, representing 18,258 tons, were fitted with internal-combustion engines, the largest being an oil-carrying steamer of 5810 tons. There were 10 other vessels, averaging 271 tons, fitted with oil engines. There were under construction a turbine-steamer of about 58,000 tons, also at the Vulkan Works at Hamburg, a steamer of about 35,000 tons, three between 20,000 and 25,000 tons (one of them to be fitted with turbines), two between 10,000 and 15,000 tons, and 30 other vessels of between 5000 tons and 10,000 tons, including 11 to carry oil in bulk, three of which were to be fitted with Diesel engines.

FRANCE. The 1912 output, 108 vessels, of 169,889 tons, constituted a better record for France than for several years, except 1911, when the total was 14,295 tons greater. Regarding the purely merchant work, however, there was a decrease of nearly 15,000 tons. The output included six vessels of over 5000 tons; the largest was the *Mississippi*, of about 7000 tons, and a turbine Channel steamer *Rowen*, of 1656 tons, was designed for a speed of 22 knots. The merchant work on hand (175,000 tons) considerably exceeded the output of 1912, and four of the vessels were between 12,000 tons and 15,000 tons. Two of these were to be fitted with combination turbines and reciprocating machinery.

NETHERLANDS. The total output of all Dutch shipping was greater than in previous years, the 117 vessels launched making up 101,642 tons. As regards the merchant work, the total was 6400 tons above the output of 1911, and was the largest ever recorded in such return. As in the case of Germany, there were not included the vessels for river navigation, of which more than 90,000 tons were launched in 1912. The larger vessels launched were three, of between 6000 and 7000 tons. Here, again, the internal-combustion engine is making headway, two large vessels and 17 small vessels having been fitted with such machinery, while on hand there are two cargo steamers, each of 4500 tons, to be propelled by Diesel engines.

JAPAN. The total merchant and war tonnage produced included 174 vessels of 88,731 tons, which is about 7000 tons more than in the previous year. The merchant tonnage consisted almost entirely of small vessels, with the exception of two steamers of about 6500 tons. The increase in the merchant total, it will be seen, was about 13,400 tons.

AUSTRIA-HUNGARY. This country showed an increase of 30,637 tons. Part of this, however, was due to activity in warship-building, the increase in merchant work being only 3000 tons. The output was made up almost entirely of vessels between 5000 and 8000 tons. In progress there are new ships of 57,000 tons.

NORWAY. The Norwegian total, composed entirely of merchant vessels, with the exception of one warship of 103 tons, represented 50,358 tons, the measurement of 90 vessels, nearly all small craft. This was nearly 15,000 tons more than in the previous year.

BRITISH COLONIES. The output, of course, did not include any warships, and was 15,000

tons more than in 1911. Only a small proportion of the increase was due to sea-going tonnage.

DENMARK showed an increase of less than 7000 tons, and there were included in the output two vessels of 4934 tons and 3718 tons, fitted with Diesel engines. This method of propulsion was recorded by Lloyd's Register as being adopted by several cargo vessels of considerable size building in Copenhagen.

In the table below are given the steam and sailing vessels of over 100 tons, number, and net and gross tonnage of the several countries of the world, as recorded in Lloyd's Register for 1912-13:

depth far above the water line. The propelling machinery consisted of turbines of unusual power.

The *Aquitania*, whose tonnage was stated at 45,000 tons, was also fitted with steam turbines which were adopted for two other ocean liners of 16,000 tons, and four steamers, of a total tonnage of 4150 tons. Including the *Britannic*, of 50,000 tons, there were nine steamers, with a total gross tonnage of 194,380 tons, to be fitted with a combination of steam turbines and reciprocating engines. One of these, of 32,500 tons, was for the Holland-America Line; another, of 27,000 tons, for the Red Star Line; two Royal Mail liners, of 29,900 tons; two ves-

NOTABLE STEAMSHIPS. The year 1912 was noteworthy for the building of three steamships larger than any previously built—the Hamburg-American liner *Imperator*, the Cunard liner *Aquitania*, and the White Star liner *Britannic*. The *Imperator* was 919 feet long, 96-foot beam, and of over 50,000 tons displacement, being some 5000 tons larger than the *Olympic*. This vessel, which had been under construction since June 18, 1910, was launched from the Vulcan Shipbuilding Works at Hamburg. She weighed 27,000 tons when launched, and was the first four-screw turbine steamship of the German mercantile fleet. The ship was supplied with both longitudinal and transverse bulkheads and a double bottom, the longitudinal bulkhead in the engine room extending from the bottom 50 feet upward to the second

sels, of 31,200 tons, for the Pacific Steam Navigation Company; one of 14,980 tons; and another of 8800 tons.

In 1912 eight commercial ships with oil engines were put into commission, as against three such vessels in 1911, the horsepower amounting to 3350, and averaging 1660 per ship. The three pioneer vessels made successful records during the year, and two of them made extensive trips to the Far East. Most of the new construction for the year was being built in the works of Holland, Denmark, and Germany, while an English Diesel combination was established at Glasgow during the year.

Two vessels, of between 3000 and 4000 tons each, along with a number of small craft, were being fitted with internal-combustion engines. Attention, however, was called to the fact that

with forty steamers, of a total tonnage of about 231,000 tons, being built to carry oil in bulk, this number of motor-ships seemed small; because if marine engineers and ship-owners were satisfied with the reliability of the oil-engine, oil-carrying ships presented a most favorable opportunity for the application of the system, as commercial conditions were favorable. No better scope for the application of the system could be found. But British firms were obviously indisposed, with the great demand for tonnage manifested during the year, to risk experiments on such a scale.

SHIPPING. See SHIPBUILDING.

SHOES. See BOOTS AND SHOES.

SHOOTING. The United States carried off the honors in shooting in 1912 by winning the most important events in three international matches. These contests were held at Buenos Ayres, Argentina, Ottawa, Canada, and at the Olympic games in Stockholm. In the competition at Buenos Ayres there were five marksmen on a side, each man firing 120 shots—40 standing, 40 kneeling, and 40 prone—at a range of 350 meters. Out of a highest possible score of 6000 points, the U. S. team made 4729 and Argentina 4598. The individual championship was won by Capt. Stuart W. Wise of Massachusetts. In the matches for the Palma Trophy at Ottawa, the U. S. defeated Canada by 1720 points to 1712 at 800, 900 and 1000 yard ranges. For a summary of the shooting matches at Stockholm, see OLYMPIC GAMES.

The principal rifle matches held in the U. S. during the year were those held under the auspices of the National Rifle Association at Sea Girt, N. J. The individual military championship was won by Corporal C. B. Long, of the Massachusetts Volunteer Militia, with a score of 235. Other events and winners were: Wimbledon Cup (1000 yards, 20 shots), A. L. Briggs, U. S. A., 497; Leech Cup (800, 900, and 1000 yards, 7 shots), Sergeant F. H. Keene, Massachusetts Volunteer Militia, 104; Marine Corps (600 and 1000 yards, 15 shots), Capt. G. H. Emerson, Ohio National Guard, 194; Regimental Team match, First Infantry District of Columbia National Guard, 754; Company Team match, Company K, First Infantry, D. C. N. G., 364; Revolver Team match, First Squadron, New York National Guard, 1031.

The outdoor championship matches of the U. S. Revolver Association were held throughout the various States from September 28 to October 6. The winners of the more important events were: Target revolver, A. M. Poindexter, Denver, 467; target pistol, L. P. Castaldini, Springfield, Mass.; military revolver and military record matches, Dr. J. H. Snook, Columbus, Ohio; military revolver team match, Denver Revolver Club. The Association was represented in the Olympic Games (q. v.)

The world's amateur championship at trap shooting was won by George L. Lyon, who defeated L. S. German at Wilmington, Del. German, however, retained his championship title in the professional matches. The world's amateur team championship went to J. R. Graham and R. W. Clancy. B. M. Higginson captured the national amateur championship.

The intercollegiate indoor championship of the U. S. (rifles) was won by the Massachusetts Agricultural College, and the outdoor championship by Harvard.

SHUTTLEMAKERS' DISEASE. See INDUSTRIAL DISEASE.

SIAM. An independent kingdom of south-eastern Asia, extending approximately from the 6th to the 20th degree of north latitude and from the 97th to the 106th degree of east longitude; length from north to south, approximately 1020 miles, and greatest breadth, 480. Coast line, 1300 miles; total area, about 198,900 sq. miles.

POPULATION, ETC. The country is divided into 17 monthons (circles), subdivided into 79 muangs (provinces), which are again subdivided into 409 amphurs (districts); these are in turn made up of 3993 tambons (villages), divided into mu bans (hamlets). According to an official report issued in November, 1910, the population of the kingdom was 7,561,977; of whom lay males numbered 3,707,466 and lay females 3,729,021, and persons in holy orders numbered 142,636. The racial figures for the Bayap and Isarm monthons are not yet available. In the remaining monthons the Siamese numbered 4,419,506 (639,920 in Bangkok monthon); Chinese, 370,134 (197,918); Malays, 363,756 (20,764); Cambodians, 83,762; Mohns, 27,280; Karens, 17,512; Annamites, 6647. There are upwards of 2000 Europeans and Americans resident in Siam, mostly in Bangkok.

The ministry of public instruction is generally responsible for all government schools. It has drawn up a plan of education for the entire country, which is now partly in operation. There are besides government-aided private schools, and several missions. The religion of the court is Buddhism, and large educational powers are in the hands of the Buddhist monks.

PRODUCTION. Agriculture is carried on under primitive conditions. Wooden plows are used, drawn by water buffaloes in the stiff lowland clays and by bullocks on the sandier highlands. Irrigation is practiced, and rice is the leading crop. Many of the varieties grown are considered by experts to be among the finest in the world. The production next in importance after rice is teak. The forests in which this species occurs are situated for the most part in the monthons of Bayap, Nakonsawan, and Pitsanulok, and are leased to private companies for a term of years, usually 15. Teak is worked by girdling the trees, leaving them standing for two years to season, and felling them; they are then dragged, mostly by elephants, to the nearest streams, down which they are floated to the duty station at Paknampoh, where they are measured and the duty is collected before they are sent to Bangkok. Before the organization of a government forestry department the teak forests were ruthlessly exploited, all the more accessible tracts having been so overworked that they will supply no more teak for another fifty years. Rosewood and other valuable timbers are found in lower Siam, and efforts are being made to work them upon a commercial basis.

The only minerals worked on a commercial scale are tin and wolfram. Seven-eighths of the tin comes from the Puket monthon (70,718 piculs in 1910-11). The output from the east coast is small, though it is hoped that the new railway will develop the industry there. Since the cession to the French of the Pailin district (1907) the gem industry has ceased to be of importance; gems are found near Krat and elsewhere, but their value is negligible.

COMMERCE. In the table below are seen imports and exports for 1909-10 and 1910-11, with

the five-year average from 1905-1910, in ticals (1 tical=about 36.5 cents):

Imports:			
	1909-10	1910-11	Average

* Cotton goods in the 1910-11 trade, 11,808,211 ticals; silk goods, 3,744,304; gunny sacks, 3,453,391; provisions, 4,775,442; oil, 3,636,652; machinery, hardware, etc. † 17,588,349 piculs in 1910-11. Buffalo- and cow-hides (1910-11), 1,267,940 ticals; bullocks, 248,820; buffalo horns, 190,571; other horns, 39,732; hogs, 226,923; fish (platoo), 849,613; other fish, 729,723; dried mussels, 460,012; pepper, 689,070; rough rubies, 30,000; tin oxide, 15,943; etc.

Total imports 1911-12, 73,139,000 ticals (U. K., 17,971,000; Singapore, 11,078,000; China, 10,024,000; Hongkong, 8,741,000; British India, 5,034,000; Germany, 4,783,000; Dutch possessions, 3,026,000); total exports, 84,634,000 (through Singapore, 40,111,000; Hongkong, 25,618,000). Rice exports 1911-12, 65,841,000 ticals; teak, 6,113,000. Vessels entered 1911-12, 735 steamers, of 624,608 tons. Merchant marine, 1912, 29 steamers, of 8725 tons, and 91 sailing, of 7442.

RAILWAYS. The total length (April, 1911) of state and private railways was 1093 kilometers, of which 106 kms. were privately owned narrow-gauge lines and 987 belonged to the state, as follows: Bangkok to Korat, 264 kms.; the Lopburi line, 42 kms., which constitutes a section of the projected Northern Railway; the Southwestern, 151.5 kms., from Bangkok via Nakonchaisi to the Mekong, thence south to Petchaburi; another section of the Northern, 118 kms., Lopburi to Paknampho, with extension to Pitsanulok, 138 kms. The first section of the Eastern line, from Bangkok to Petrii, 63 kms., was opened in January, 1908; the section of the Northern, from Pitsanulok to Ban Dara, 67.7 kms., on November 11, 1908; the section Ban Dara, Utaradit, Pang Ton Phung, 52.5 kms., August 15, 1909, together with a branch from Ban Dara to Sawankalok, 29 kms.

The Pang Ton Phung to Meh Puak line, 19 kms., was opened June 1, 1911, and replaces the caravan route from Utaradit to Phrae over the Kao Plung pass. The first section of the Southern line, Petchaburi to Ban Cha Am, 36 kms., was completed June 19, 1911, and a further section of 24 kms. to Hua Hin before the end of the year.

Under construction on the Northern is the short section of 5 kms. from Meh Puak to Dene Chai, the temporary terminus until the extension to Chiangmai is authorized. The ultimate terminus of the Southern Railway is the Kelantan boundary by an extension from Trang, a total distance of 970 kms. (distance from Petchaburi to Trang, 676 kms.). The line will serve a population of over 1¼ millions, and open up

fertile tracts; it will also develop the mining districts and accelerate the mail service to Europe.

FINANCE. The estimated revenue in 1911-12 was 62,321,000 ticals. Ordinary expenditure, 62,235,539; for railway construction, 9,660,670; for irrigation, 2,014,399—total extraordinary, 11,675,069; making a total estimated expenditure of 73,910,608. The public debt (1911) stood at £7,000,000; paper currency, March 31, 1911, 18,770,220 ticals. The reserve fund established under the Gold Standard act now stands at £945,941, held entirely in gold, and reserved absolutely for the purpose of maintaining the stability of exchange.

ARMY. A standing army of about 25,000 is maintained, and under the terms of the law of 1905 a system of universal military training was in force. The troops are armed with Mannlicher and Mauser rifles.

GOVERNMENT. The government is an absolute monarchy, and succession is limited to the princes of the blood ranking highest among the king's sons. The present king being without male issue, the succession passes presumptively through the line of the queen-mother's sons according to their respective ages. Reigning king, (Somdet Phra Paramindr) Maha Vajiravudh; born January 1, 1881, proclaimed successor and crown prince 1895, and succeeded to the throne October 23, 1910. He was educated at Oxford and has traveled extensively. Bangkok is the seat of government.

It was announced early in March that documents had been discovered revealing a widespread conspiracy at Bangkok involving officers of the army and navy, in both of which branches of the service a mutiny had been brought about. This discovery led to the arrest of many persons. They were tried by court-martial, which sentenced three to imprisonment for life and twenty to twenty years.

SIBERIA. See RUSSIA, and EXPLORATION.

SIERRA LEONE. A British colony and protectorate (32,110 sq. miles; 1,400,000 inhabitants, as estimated December 31, 1910); a country on the west coast of Africa. The capital, Freetown, had (1911) 34,090 inhabitants. The colony proper contained (census of 1911) 75,370 inhabitants (40,896 males); of whom 702 were white (640 males) and 74,668 (40,256 males) colored. The death rate in Freetown in 1910 was 27 per thousand.

	1907	1908	1909	1910
Imports ..£	938,022	£ 813,700	£ 978,807	£1,162,470
Exports ..	831,259	786,755	981,466	1,249,367
Revenue ..	359,104	321,000	361,326	425,215
Expend. ..	345,567	341,871	336,746	361,222
Shipping*	1,890,581	2,046,152	2,191,132	1,994,290

* Tonnage entered and cleared.

a Palm kernels, £644,684; kola nuts, £191,942; silver, £185,965; palm oil, £62,852; coal, etc., £62,434; ginger, £23,288; raw rubber, £7666.

The main railway (the first to be opened in British West Africa) extends from Freetown to Balma, 220¼ miles. Branch lines run to the Hill Station (6 miles) and to government wharves, etc. A branch line from Boia to the Rokell River was under construction in 1912. Telegraph lines, 298 miles. Sir E. M. Meredith was governor in 1912.

SILK. The silk industry in 1912 suffered from various developments in world politics. The revolution and the new republic in China

disturbed business conditions in that country, while the war between Italy and Turkey involved two important silk-producing nations. Likewise the Balkan War had its effect upon raw silk production, for in the silk production for 1911-12 European Turkey and the Balkan States were responsible for 7,034,747 kilograms of cocoons or 603,000 kilograms of silk, which production was divided into 375,000 kilograms produced by Salonica and Adrianople and 228,000 by the Balkan States and Greece. The production of France and Italy, however, increased during the year, and a greater amount of raw silk was handled in the European conditioning works than in 1911, while European mills were busy throughout the year, though with a less active demand near its close. The imports from Japan to the United States were greater in 1912 than in 1911, but to Europe less, while the shipments from Shanghai to the United States were also greater in 1912 than in 1911, Canton, however, showing a small decrease in 1912 from the figures for 1911. Italy made shipments in the last three months of 1912 to the United States more than double those of 1911. Of the old crop, 54 per cent. of the total exports of the Asiatic market was sent to the United States, as against 39 per cent. taken by Europe, the balance going to India and the Eastern markets.

SILK CROP ESTIMATE. The world silk crop for 1912-1913 at the end of the year was estimated at about 24,000,000 kilograms (52,910,000 pounds), or an excess over the season of 1911-1912 of about 6 per cent. The reports from almost all of the silk-producing countries showed an increase over the previous year's crop, except in the Levant, where a shortage of about 10 per cent. from the previous year was estimated, due to a deficiency in the yellow cocoon of Syria and of the white cocoon in Bruti and Adrianople. Italy's crop for 1912 was estimated at about 15 per cent. in excess of that for 1911. France showed an increase of about 30 per cent. Hungary and Spain were approximately the same, as was also Japan, while Canton, where the 1911 production was abnormally small, showed an increase of about the normal average. The accompanying table from the *American Silk-Journal* gives the estimated totals of the different countries compared with the results for the two years previous, the quantities being in kilograms.

Europe	5,050,000	4,330,000	4,700,000
Levant	2,550,000	2,800,000	2,800,000
Japan	9,300,000	9,320,000	8,930,000
China	4,700,000	4,300,000	3,510,000
Canton	2,100,000	1,680,000	2,630,000
India	300,000	220,000	230,000
	24,000,000	22,650,000	22,800,000

This table does not include the tussah raw silk, the estimated production of which, in the season 1912-13, was given at 8,439,000 pounds.

It was reported that the secretaries of agriculture and commerce in France were preparing a bill to make compulsory the indelible marking of each and every article containing artificial silk as such, in order to maintain the quality of the French silk products and protect natural silk against the invasion of the artificial product. Nevertheless, in Europe artificial silk continues to make headway and a number of large factories are now at work on

its production. Many of the leading makers, however, failed to show a profit and several concerns reported a net loss on the year's business. On the other hand an English concern operating in the United States was reported as paying 35 per cent. in dividends, while a German factory at Elberfeld paid 36 per cent. These concerns, however, were considered the most successful manufacturers in the business, and it was the general opinion that taking the industry as a whole the gains and losses would about balance.

The silk industry in the United States was not particularly concerned with tariff questions during the year, but at its close, it was anticipated that changes more or less radical would be made in Schedule L.

Silk manufacturers of the United States were busy throughout the year, but with varying degrees of prosperity, as in many cases it was thought that the manufacturing business has been conducted upon too close a margin. Nevertheless, the use of silk greatly increased and silk and silk fabrics were favored by fashion. However, the actual consumption of silk fabrics during the year was restricted by the fashion which continued to decree narrow skirts and limited material. This was offset in some degree by the use of more costly and elegant silks and their continuance in general favor.

The total number of silk manufacturers in the United States in 1912 as given by *Davison's Directory of the Silk Trade* (1913) was stated at 1552, an increase of 97 mills over the number in 1911. In New Jersey there were in 1912 380 as against 382 in 1911, and of these 293 were in Paterson, as compared with 300 in 1911. The State of New York had 375 in 1912, as compared with 348 in 1911, or a gain of 27, while Pennsylvania had 473 in 1912, as compared with 420 in the previous year. There were 394 broad silk mills in 1912, as against 387 in 1911, 25 more ribbon mills and 32 more mills manufacturing webbing and narrow fabrics. In 1912 there were 199 throwing and spun silk mills, or 3 less than in 1911, while the knit goods mills using silk were 340, as against 250 in the earlier year. The number of dyers and finishers of silk and silk mixed goods at the end of 1912 was 133, as compared with 123 in 1911, while there were seven more mills devoted to cotton and silk, and worsted and silk mixtures.

SILVER. The production of silver in the United States as a whole and by States is shown in the table on page 656, prepared by the director of the mint. It will be seen from this table that the production in the continental United States was slightly larger in 1912 than in 1911:

WORLD PRODUCTION. The silver production of the world in 1911-12 is shown in the table on page 656, which is taken from the *Engineering and Mining Journal*. It will be seen from this table that Mexico continues to be the chief producer of silver, with the United States second and Canada third:

UNITED STATES SILVER PRODUCTION

(Fine Ounces)		
	1911	1912
Alabama	174	237
Alaska	275,691	516,224

Total value	\$32,196,296	\$37,942,773

SILVER PRODUCTION OF THE WORLD

(Fine Ounces)		
	1911	1912
Mexico	79,032,440	76,500,000
United States	60,399,400	62,369,903
Canada	32,740,748	35,250,000
Australasia	16,578,421	17,950,000
Other countries	36,621,835	37,500,000
Total	225,372,844	229,569,903

EXPORTS AND IMPORTS. The total imports of silver into the United States in 1912 amounted to \$44,402,933. The total exports to \$64,343,611. The exports from the United States are chiefly to Great Britain, though in 1912 there were considerable sales to France for coinage purposes.

MARKET IN 1912. The monthly average price of silver in New York in 1911-12 is shown in the table below, which is taken from the *Engineering and Mining Journal*:

MONTHLY PRICE OF SILVER

Month	1911	1912
January	53.795	56.260
February	52.222	59.043
March	52.745	58.375
April	53.325	59.207
May	53.308	60.880
June	53.043	61.290
July	52.630	60.654
August	52.171	61.606
September	52.440	63.078
October	53.340	63.471
November	55.719	62.792
December	54.905	63.365
Year	53.304	60.835

SINGAPORE. See STRAITS SETTLEMENTS.
SINGER, EDMUND. A Hungarian violinist, died January 26, 1912. He was born at Fort

Totis, Hungary, in 1831. He studied music under Ellinger at Budapest and later with Ridley Kohner. At the same time he appeared in public in concerts in Austria and Germany. He later studied at the Paris Conservatory. In 1846 he became first violinist of the Budapest Opera and ten years later was conductor at Vienna. From that time until his death he was one of the conductors of the Royal Opera at Stuttgart and professor of the Conservatory in that city. He was regarded as a brilliant concert master and a fine teacher. He composed a variety of compositions for the violin and was the author of a method which became popular. Shortly before his death his reminiscences were published.

SKATING. The international outdoor skating championships were held at Saranac Lake in February, R. M. McLean, of Chicago, and R. L. Wheeler, of Montreal, winning a majority of the events. McLean finished first in the mile and three miles, while Wheeler won the quarter-mile, half-mile, and two miles. L. Roe, of Toronto, captured the 220-yard dash. In the international indoor championships held at Boston, McLean won the half-mile, mile, and two miles; H. B. Kaad, of Chicago, won the quarter-mile, and O. B. Bush, of Vancouver, the 220-yard dash. Edmund Lamy and Morris Wood met at Saranac Lake to decide the American professional championship, Lamy winning the half-mile, three-quarter-mile, mile, and two miles, and Wood capturing the 220-yard dash and quarter-mile. Abroad, O. Mathiesen, of Christiania, established three new world's amateur records. He skated 500 meters in 44 1/2 seconds, 1500 meters in 2 minutes, 20 1/2 seconds, and 10,000 meters in 17 minutes, 46 3/10 seconds.

The winners of the various roller-skating championships held in the United States were: 1-mile world's professional, H. Davidson, St. Paul, Minn.; 2-mile world's professional, R. Peters, St. Louis; 1-mile world's amateur, L. Kimm, Chicago; 1-mile eastern professional, W. Blackburn, New York; 2-mile eastern professional, W. Blackburn; 3-mile eastern professional, W. Blackburn; 4-mile eastern professional, F. J. Clarke, New York; 5-mile, W. Blackburn; 1-mile eastern amateur, J. Timney, Newark; 2-mile eastern amateur, F. J. Clarke, New York; 3-mile eastern amateur, W. Burke, Brooklyn; 4-mile eastern amateur, W. Burke; 5-mile eastern amateur, J. Timney.

SKEAT, WALTER WILLIAM. An English philologist and educator, died October 7, 1912. He was born in London in 1835 and was educated at Christ's College, Cambridge. In 1860 he was elected a fellow of this college. In the same year he was ordained to the ministry and held curacies at East Dereham and at Godalming. Owing to an affection of the throat he was obliged to abandon the ministry. He returned to Cambridge and resumed studies of English, philology, and literature. In 1873 he assisted in the foundation of the English Dialect Society, becoming its first director and afterwards its president. He had already begun the editing of the Middle English texts for the Royal English Text Society which had been established by F. J. Furnival. In 1878 he was appointed the Elrington and Bosworth professorship of Anglo-Saxon at Cambridge and in 1883 was re-elected a fellow at Christ's College. He was a very voluminous writer on philological subjects and was one of the most emi-

ment philologists living at the time of his death. He covered in his writings almost all of Chaucer, and wrote several dictionaries of words used at various periods. Among his published writings are: *Launcelot of the Laik* (1865); *Piers the Plowman* (1865-1884); *Etymological Dictionary of the English Language* (1879-1884); *Notes on English Etymology* (1901); *Primer of Classical and English Philology* (1905); *Proverbs of Alfred* (1907); and *Early English proverbs* (1910).

SKYSCRAPERS. See TALL BUILDINGS.

SLEEPING SICKNESS. The activities of the British Sleeping Sickness Commission, appointed by the Colonial Office under the general direction of Sir David Bruce, were centred on discovering how large a part the fly *Glossina morsitans* had in the transmission of the trypanosomes and to what extent wild and domestic animals served as reservoirs of infection. Until 1911 the tsetse fly, *Glossina palpalis*, was believed to be the sole carrier of sleeping sickness; but the occurrence of cases in regions where this fly did not exist (Rhodesia and Nyasaland) made further study imperative. Drs. Kinghorne and York, working in the Luangwa Valley, northern Rhodesia, found that *Glossina morsitans* transmits, in nature as well as in laboratory experiments, the human trypanosomes of that region, and that wild animals are naturally infected. Ninety-eight wild animals were examined, 77 antelopes and 8 wild pigs. In 7 antelopes and 1 pig human trypanosomes were found. It was also shown that in other parts of Africa cattle and other domestic animals may harbor human trypanosomes without detriment to health. Consequently, it is possible that domestic animals, subject to the bites of *Glossina morsitans*, also harbor the human trypanosomes in Rhodesia and Nyasaland. This will greatly complicate the problem, because it is out of the question to decree the destruction of all the domestic animals in Nyasaland. Similarly, it follows that the destruction of all or the greater number of the wild animals, which has been advocated, would be useless. It is possible that if this were done the fly, unable to obtain the blood of these animals, would attack man and the domestic animals to a greater extent. The work done and conclusions reached by the investigators in Northern Rhodesia are summarized as follows: (1) The human trypanosomes in the Luangwa Valley are transmitted by *Glossina morsitans*; (2) approximately 5 per cent. of the flies may become permanently infected and capable of transmitting the virus; (3) the period which elapses between infection and outbreak is fourteen days; (4) an infected fly retains the power of transmitting the disease during its life and is infective at each meal (5) mechanical transmission does not occur if a period of twenty-four hours has elapsed since the infecting meal; (6) there is some evidence that in the interval between the infecting feed and the date on which transmission becomes possible the parasites found in the flies are non-infective; (7) certain species of buck have been found to be infected with the human trypanosome; (8) a native dog has been found infected.

SMALL-POX AND VACCINATION. Dr. R. L. Dixon states that during the first three months of 1912 there were reported 283 cases of small-pox in Michigan. The vaccination his-

tories of these cases are as follows: 17 patients were vaccinated between 1 and 10 years previously; 5 between 10 and 20 years previously; 1 between 20 and 30 years previously; 2 as far back as between 50 and 60 years previously, and several "in childhood," "years ago," "doubtful, if ever," etc.; but 245 had never been vaccinated. It costs Michigan \$150,000 a year to take care of indigent small-pox patients and to protect the unvaccinated. Dixon believes that these figures constitute as powerful an argument for thorough vaccination and could well be advanced.

In a recent bulletin, issued by the Public Health and Marine Hospital Service the laws and regulations of the several States relating to vaccination have been compiled and analytically compared. There is a marked lack of uniformity; legal requirements for compulsory vaccination exist only in Kentucky, the Philippine Islands, and Porto Rico. In Kentucky, the law requires that children shall be vaccinated within twelve months after birth. All minors and adults are also to be vaccinated. Persons coming into the State to reside must be vaccinated within six months. But there seems to be no penalty for violation of the law and the statute has not been enforced. In the Philippine Islands, every child three months of age must be vaccinated. Persons not furnishing satisfactory evidence of immunity to small-pox must be vaccinated as often as required by the health authorities. In Porto Rico, the board of health requires that every person shall possess a certificate of vaccination. Arizona, Hawaii, Maryland, New Mexico and North Dakota have laws requiring the vaccination of children, which, enforced, would in time produce a population of which large proportion would have been vaccinated at least once. In Hawaii, every child is to be presented for vaccination within six months after birth. In Maryland, it is made the duty of parents and guardians to have children under their care vaccinated within twelve months after birth or as soon thereafter as practicable. Guardians are also to have other persons under their control, and not previously vaccinated, vaccinated prior to November 1. In New Mexico, it is the duty of the county school superintendents to see that all children of school age in their respective counties are vaccinated or have been vaccinated within a year. In North Dakota, parents or guardians are to cause minors or other persons under their care or custody to be vaccinated.

Although small-pox has been widely prevalent in the United States for years, it has, probably because of its general extreme mildness, received less attention than should have been given to it. In many sections it has been so mild that the death rate has been as low as 0.2 per cent. In most countries, the death-rate varies from 15 to 40 per cent., and this was apparently true in the United States previous to 1898. The mildness of the present form of small-pox does not show that the people of this country are peculiarly immune or resistant to the disease, as has been proved by repeated local outbreaks of the virulent form. See VITAL STATISTICS.

SMILEY, ALBERT KEITH. An American educator and humanitarian, died December 2, 1912. He was born at Vassalboro, Me., in 1828 and graduated from Haverford College in 1849.

He was an instructor in that institution until 1853. In that year, with his brother, he founded and became principal of the English and Classical Academy at Philadelphia, remaining in this position until 1857. He became in 1858 principal of the Oak Grove Seminary at Vassalboro, Me., and two years later was chosen principal of the Friends' Boarding School at Providence, R. I. Here he remained until 1879. In 1869 he purchased property at Lake Mohonk, Ulster County, New York, which by subsequent additions ultimately included 5500 acres. Here in 1870 he built a hotel as a summer resort. From 1882 to 1904 he yearly invited to this place about 200 persons as his personal guests for four days to discuss the Indian question. From 1904 onward the question of other dependent peoples (Philippines, Porto Rico and Hawaii) was included. During each spring since 1894 a similar conference was held in the interest of international arbitration. To this about 300 personal guests were invited for four days. In 1889 Mr. Smiley purchased jointly with his brother a large property at Redlands, Cal. This property was thrown open to the public and is visited yearly by many tourists. In 1898 he presented to the city of Redlands a public library and an adjoining park at a cost of \$60,000. He was a member of the board of trustees of Brown University and was a member of the original board of trustees of Bryn Mawr College. He was a member of many philanthropic and humanitarian societies and organizations. The reports of the conferences on international arbitration have been published each year and have contained valuable data bearing on the subject.

SMITH COLLEGE. An institution for the higher education of women at Northampton, Mass., founded in 1871. The enrollment in all the departments of the college in the autumn of 1912 was 1523. The actual teaching faculty numbered 110. There were 30 others, instructors and assistants. During the year Professor H. M. Tyler and Professor B. K. Emerson retired, and Miss Ada M. Comstock, A. M., Litt. D., was appointed dean of the college. A conditional pledge of \$200,000 was made by the general education board. The productive funds of the college amounted in 1911-12 to \$1,227,821, and the income to \$376,401. The library contained 40,300 volumes. President, Marion L. Burton.

SMITH, EDWIN. An American astronomer and geodesist, died December 2, 1912. He was born in New York City in 1851 and graduated from the College of the City of New York in 1871. He carried on private studies in astronomy and geodesy and in 1870 entered the United States Coast and Geodetic Survey, of which he was appointed assistant in 1874. In the same year he was astronomer in charge of a party to observe the transit of Venus at the Chatham Islands in the South Pacific Ocean. He had charge of a party for the same object at Auckland, New Zealand, in 1882. He determined the force of gravity at Auckland, Singapore, Sydney, Tokyo, San Francisco, and Washington. From 1879 to 1894 he was in charge of the instrument division of the United States Coast and Geodetic Survey. During this time he also carried on observations for the variation of latitude at Rockville, Md. In 1895 he left the Coast and Geodetic Survey and was with the New York State Land Survey

until 1897, when he was again appointed assistant in the Coast and Geodetic Survey. In 1899 he established the International Geodetic Association Latitude Observatory at Gaithersburg, Md., and made observations for variation of latitude from October, 1899, to January, 1901. From the latter date until the time of his death he was engaged on astronomical, magnetic, and geodetic work of the Survey. He was a member of many learned societies and was one of the founders of the Cosmos Club, Washington. He contributed several papers, published as appendices to Coast and Geodetic Service Reports.

SMITH, GERRITT. An American organist and composer, died July 21, 1912. He was born in Hagerstown, Md., in 1859. He was educated at Hobart College and studied music and architecture abroad. He was successively organist at St. Paul's Cathedral, Buffalo, St. Peter's Church, Albany, and the Old South Church, New York. This position he held from 1895 to the time of his death. He was professor of music at the Union Theological Seminary and was professor of theory at the Master School, Brooklyn. In this city he gave over three hundred free organ recitals. He was the founder and for six years the president of the Manuscript Society of Composers and was at one time honorary president of the American Guild of Organists. He was well known as a composer and writer on musical topics. Among his compositions are: *King David*, a cantata; *Song Cycle*; and over seventy-five songs, numerous piano pieces, carols, and church anthems.

SMITH, JOHN BERNHARDT. An American entomologist and educator, died March 12, 1912. He was born in New York City in 1858 and was educated in the public schools. After studying law he was admitted to the bar in 1879. In 1884 he acted as special agent of the entomological division of the United States Department of Agriculture. He was appointed assistant curator of the United States National Museum in 1886. In 1898 he was appointed State entomologist of New Jersey. He acted as professor of entomology at Rutgers College and entomologist of the New Jersey Agricultural College Experiment Stations from 1889 to the time of his death. He did notable service in checking the mosquito pest. He was a member of many learned societies and contributed many articles to government and technical publications. He was the author of *Economic Entomology for the Farmer and Fruit Grower* (1896), and *Our Insect Friends and Enemies*.

SMITH, WILLIAM. An American soldier, died January 17, 1912. He was born in Orwell, Vt., in 1831 and graduated from the University of Vermont in 1854. He served throughout the Civil War as paymaster and as regimental officer. He was brevetted lieutenant-colonel in 1865. After the close of the war he was appointed major and paymaster in the United States army and was promoted to various grades until he became brigadier-general and paymaster-general in 1890. He was retired by operation of law in 1895.

SMITH, WILLIAM WAUGH. An American educator, died November 29, 1912. He was born in Warrenton, Va., in 1845 and served in the Confederate army from 1862 to 1865. He was twice wounded. After the war he studied

at Randolph-Macon College. In the same year he became associate and later senior principal of Bethel Academy. In this position he remained until 1878, when he became a professor in the Randolph-Macon College. In 1886 he was chosen president of this institution and in 1897 chancellor. He raised large sums to build and endow the Virginia institutions organized into the Randolph-Macon System. He was founder of the Randolph-Macon Woman's College at Lynchburg, Va. He was the author of *Outlines of Psychology* (1880); *A Comparative Chart of Syntax of Latin, Greek, German, French and English* (1882), and numerous educational tracts, magazine articles, and poems.

SMITHSONIAN INSTITUTION (THE). A learned institution in Washington, D. C., established in 1846 under the terms of the will of James Smithson of England, who bequeathed his fortune "to the United States of America, to found at Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men." This bequest, which eventually amounted to \$541,379.63, was formally accepted by the United States, and the institution was established by an act of Congress, approved August 10, 1846. The original endowment has been increased by gifts and bequests from Thomas G. Hodgkins and others, to a total permanent fund, June 30, 1912, of \$986,918.69. The interest on this amounted to \$58,375.12, and with various other funds provided by friends of the institution for special purposes, made available a total of \$107,168.31 for carrying on the operations and activities of the institution for the year ending June 30, 1912. For the maintenance of the six government branches under the direction of the Smithsonian, Congress appropriated \$742,000.

The statutory members of the institution are the President of the United States, the Vice-President, the chief justice, and the heads of the executive departments. A governing body, known as the board of regents, and consisting of the Vice-President of the United States, the chief justice, three members of the Senate, three members of the House of Representatives, and six citizens selected by joint resolution of Congress, administers the affairs of the institution. This board elects a chancellor as its presiding officer. The present incumbent is the chief justice of the United States. The roll of the regents at the close of the year 1912 was as follows: Edward D. White, chief justice of the United States, chancellor; Shelby M. Cullom, member of the Senate; Henry Cabot Lodge, member of the Senate; Augustus O. Bacon, member of the Senate; John Dalzell, member of the House of Representatives; Scott Ferris, member of the House of Representatives; Irvin S. Pepper, member of the House of Representatives; Andrew D. White, citizen of New York; Alexander Graham Bell, citizen of Washington, D. C.; George Gray, citizen of Delaware; Charles F. Choate, Jr., citizen of Massachusetts; John B. Henderson, Jr., citizen of Washington, D. C., and Charles W. Fairbanks, citizen of Indiana.

The executive officer is the secretary of the institution, who is elected by the board of regents. Dr. Charles D. Walcott has served in this capacity since 1907. There are also two assistant secretaries: Dr. Richard Rathbun, in charge of the National Museum, and Dr. Fred-

erick W. True, in charge of the Library and Exchanges.

The institution administers the United States National Museum (q. v.), including the National Gallery of Art; the Bureau of American Ethnology; the National Zoölogical Park; the Smithsonian Astrophysical Observatory; the International Exchange Service; and the Regional Bureau for the United States of the International Catalogue of Scientific Literature.

EXPLORATIONS AND RESEARCHES. During the past year several scientific exploration and research parties have been conducting field operations under the direction of the institution so far as its limited income and the generosity of its friends have permitted, and opportunity has recently been offered for participating in a number of privately-organized hunting and exploring enterprises, whereby scientific collections of great importance have been obtained for the National Museum.

PALEONTOLOGICAL. The secretary, Dr. Walcott, continued in 1912 his studies and collected Cambrian fossils from the famous fossil locality above Burgess Pass, north of Field, British Columbia, on the main line of the Canadian Pacific Railway, and made a reconnaissance survey of the geological section from Moose Pass to the summit of Mount Robson, for the comparison of the Cambrian section there with that of the Canadian Pacific Railway line.

BIOLOGICAL. One of the private expeditions in which the institution was invited to participate was that organized by Mr. Paul J. Rainey, which operated in British East Africa and southern Abyssinia for a year. All the natural history collections were offered to the Smithsonian, and Mr. Edmund Heller, late of the Smithsonian African expedition, was designated as the representative of the institution to accompany the expedition. The results were excellent, totaling some 4700 skins of animals, birds, and reptiles. Among the specimens are the series of lions secured by Mr. Rainey with his hounds, as described in his public lectures.

The institution was also represented in the expedition to Africa conducted and financed by Mr. Childs Frick, of New York, whose object was to secure a collection of animals from the territory north of that visited by Colonel Roosevelt in 1910-11, covering at the same time certain parts of Abyssinia, northern British East Africa, and the country about Lake Rudolf. Dr. Edgar A. Mearns of the original Smithsonian expedition was chosen as the naturalist of the party. About 5000 specimens of birds donated by Mr. Frick to the institution have been received, and promise to materially enrich the African bird collections of the National Museum.

In 1910 the institution, with the coöperation of several of the government departments, organized a biological survey of the Panama Canal Zone. This survey was continued in 1912, and the work accomplished thus far has added greatly to the scientific knowledge of this region. Fine collections of the mammals, birds, fishes, reptiles, and plants have been made, while special studies have been carried on concerning the microscopic plant and animal life in the fresh waters of the Zone.

Through the liberality of Dr. Theodore Lyman, of Cambridge, Mass., the institution has been enabled to participate in a zoölogical expedition to the Altai Mountain region of the Siberia-Mongolian border, Central Asia, an ex-

cellent territory from the standpoint of the hunter and collector, and one from which the National Museum has at present no collections. Mr. N. Hollister, a museum naturalist, was detailed to accompany the party, the expenses of which were provided for by Dr. Lyman, who has offered to present the natural history specimens obtained to the National Museum. Although this expedition had not completed its work at the close of the fiscal year, it is anticipated that it will result in adding to the museum collections large numbers of mammals and birds, especially specimens of the wild sheep and the ibex, the principal big game animals of this locality.

Dr. W. L. Abbott, of Philadelphia, has placed funds at the disposal of the institution for continuing the explorations he began personally some time ago in Borneo. The field-work is being done by Mr. H. C. Raven, who is collecting in eastern Dutch Borneo, the natural history of which is practically unknown. The museum will be fortunate to secure a collection from this country, and it is hoped that the characteristic mammals, such as oranges, deer, and wild pigs, and possibly specimens of the rhinoceros and tapir, may be secured.

ANTHROPOLOGICAL RESEARCHES. The institution has planned to cooperate with the authorities of the Panama-California Exposition of San Diego, to carry on researches bearing on the origin of the American Indian. In this connection Dr. Ales Hrdlicka, of the National Museum, was authorized to trace in a preliminary way the remnants of the stock of people from which, in all probability, the American race sprang. He departed on May 16 for Siberia and such parts of Mongolia and Turkestan as the time available would allow. In these places he was to study the native types which are regarded as bearing a striking resemblance to the Indian, securing not only data, but, when possible, photographs, casts and material objects. Returning from his Siberian trip, Dr. Hrdlicka will proceed to Peru, where he will study the collections there existing and make observations on the living natives, furthering his former investigations there in regard to the distribution of the various types of man in Peru.

Dr. Riley D. Moore, also of the museum, will make a trip to St. Lawrence Island, Alaska, where he intends to make a scientific study of the Eskimo tribe which dwells there. The data and material gathered are to be introduced in the exhibits for the exposition above mentioned. A large amount of anthropological work is carried on annually by the Bureau of American Ethnology.

PUBLICATIONS. In "the diffusion of knowledge among men," no agency of the institution does more than its publications, which include the "Smithsonian Contributions to Knowledge," the "Smithsonian Miscellaneous Collections," and the Smithsonian Annual Report, besides other publications. In all, about 150 new publications were issued by the Smithsonian and its branches during the year. Of these, a total of 100,231 copies was distributed to libraries and scientific institutions. These publications relate to all branches of natural and physical science.

LIBRARY. The library of the Smithsonian Institution is deposited in the library of Congress, and comprises about 285,000 publications consisting chiefly of the transactions of learned

societies and scientific periodicals. The library of the National Museum has a total of 42,000 volumes and 70,000 pamphlets. The library of the Bureau of American Ethnology contains about 21,000 volumes.

BUREAU OF AMERICAN ETHNOLOGY. This bureau is maintained by the government for the purpose of carrying on ethnological researches among the American Indians and the natives of Hawaii, and is also charged with the excavation and preservation of archeological sites and remains, under the direction of the Smithsonian Institution. Special attention is paid to the history, languages, manners, and customs of the Indians. The results of these studies are published as soon as completed in the reports and bulletins. Since its organization under the institution in 1879, the bureau has published 27 annual reports, and more than 50 bulletins.

During the year just passed much work has been done on an annotated bibliography of the Pueblo Indians by Mr. F. W. Hodge, ethnologist in charge of the bureau. He was also in the field and made a brief visit to the archeological sites of Rito de los Frijoles, and to El Morro, or Inscription Rock, where he made squeezes of the early Spanish inscriptions. Later he accompanied Dr. Edgar L. Hewett, of the American School of Archaeology, to the ruined pueblo of Kwasteyukwa in the Jemez Valley, to make investigations and collections.

Dr. J. W. Fewkes conducted field investigations among the Pueblo Indians of Arizona, and made photographs and notes of many new and interesting discoveries in other parts, which are to be printed in a report of the bureau. He is also preparing a report relating to "Designs on Prehistoric Hopi Pottery," and making a further study in anthropology in the West Indies.

Other investigations were carried on by the various representatives of the bureau among the east Cherokee of western North Carolina; the "Croatan" Indians of southeastern North Carolina; the Tewa tribes of New Mexico; the Fox Indians near Tama, Iowa; the Sauk, the Creek, the Shawnee and the Osage Indians of Oklahoma; the Kickapoo of Mexico; and the Winnebago Indians of Wisconsin; and studies were made in the music of the Chippewa and Sioux, while considerable progress was made on manuscripts and texts in the course of preparation for publication.

ASTROPHYSICAL OBSERVATORY. The Smithsonian Astrophysical Observatory was founded for the purpose of investigating solar radiations and other phenomena, and is under the supervision of Mr. Charles G. Abbot, director. The year was notable for expeditions to Algeria and California to test the supposed variability of the sun by making simultaneously, at two widely separated stations, spectrobolometric determinations of the solar constant of radiation. The measurements made at Bassour, Algeria, agree with earlier ones at Washington and on Mount Whitney, California, and indicate that Mount Wilson values are systematically a little low. Apart from this systematic error the average accidental differences between Algerian and Mount Whitney determinations were only 1.2 per cent, indicating an average accidental error of a single solar constant determination at one station of only 0.9 per cent. So far as yet reduced, high solar constant values obtained in Algeria coincide with high values at Mount Wilson and vice versa. Many values

remain to be computed, but it can hardly be doubted that the outcome will prove conclusively the irregular short-period variability of the sun. Progress also has been made in the dissemination of standards of pyrheliometry and on the absorption of radiation by atmospheric water vapor.

INTERNATIONAL EXCHANGES. This is the office of the International Exchange Service for the United States, and is conducted in accordance with the terms of a convention entered into between the United States and various other countries for the free interchange of scientific, literary, and governmental publications between governments, learned institutions, and investigators. Packages were delivered to 12,608 institutions and individuals during the first half of 1912. This bureau has handled since its establishment over 3,300,000 packages; during the last year 315,492 packages, having a total weight of 568,712 pounds. Shipments have been made to 72 different countries.

INTERNATIONAL CATALOGUE OF SCIENTIFIC LITERATURE. The institution has charge of the United States regional bureau of the International Catalogue of Scientific Literature, which, as its name implies, is a classified catalogue in book form, of current publications relating to all branches of science. Bureaus have been established in 32 different countries, with a central bureau in London. Since its inception in 1901, this international scientific catalogue has been published annually in the form of 17 separate volumes, each relating to a separate branch of science. The regional bureau for the United States is supported by an annual appropriation by Congress, and is engaged in collecting references of all current scientific publications issued in this country. The number of references forwarded to the Central Bureau last year was 27,201, or about 13 per cent. of the total for the world.

SMOKE ABATEMENT. This, or smoke reduction, is a better term than the more common American term, smoke prevention, since after all smoke cannot be wholly prevented. Abatement is widely employed in Great Britain. A review of the status of the subject in the United States was published in 1912 as *Bulletin 49*, U. S. Bureau of Mines: *City Smoke Ordinances and Smoke Abatement*, by Samuel B. Flagg. A new British book is Julius B. Cohen's *Smoke: A Study of Town Air* (London and New York, 1912). Of some 240 cities of less than 50,000 inhabitants "only 12 reported having either a smoke ordinance or an official charged with smoke inspection"; of replies from 60 cities of from 50,000 to 200,000 population, "17 are making more or less vigorous efforts to suppress the nuisance"; and of 28 cities having more than 200,000 it appears that 23 are making some effort to reduce smoke, while of 5 that "are making practically no effort," 3 use fuel oil almost exclusively. The seventh annual meeting of the International Association for the Prevention of Smoke was held at Indianapolis in September, 1912.

SNOWDEN, ARCHIBALD LOUDON. An American diplomat, died September 7, 1912. He was born in Cumberland County, Pa., in 1837 and graduated from Jefferson College in 1856. He studied law at the University of Pennsylvania. In the Civil War he served as lieutenant-colonel in the Pennsylvania volunteers and participated in several battles. After the war

he served as register and later chief coinier of the United States Mint. From 1877 to 1879 he was postmaster at Philadelphia and from 1879 to 1895 was superintendent of the United States Mint in that city. He twice declined the directorship of all United States mints, which was tendered to him by President Hayes. From 1889 to 1891 he was minister-resident and consul-general of Greece, Rumania, and Servia. He was minister to Spain from 1891 to 1893. He was well known as an orator and a writer, and was an authority on coins and coinage. He wrote many papers on these subjects. He received several decorations from foreign rulers for his diplomatic services.

SOCIAL CENTRES. One of the most interesting and promising of social movements of the day is that known as the social or civic centre movement. This is an outgrowth of the agitation for a wider use of school buildings and for the development of the spirit of community coöperation. During the past ten years there has been a gradual increase in the utilization of school houses for recreation centres, branch libraries, public lectures, and debating, musical, and dramatic clubs. The social centre movement is a logical result. It would have school houses constructed with a view to their use for a large number of recreational, amusement, and civic activities, instead of day instruction of children merely. Thus the civic centre school house will require an auditorium, library and reading rooms, and movable school desks. Then under the control of the educational authorities there will be organized in each community games and dancing for young and old; gymnastic and bathing opportunities; singing societies, orchestras, glee clubs, and other musical efforts; literary, debating, and civic clubs; and public lectures on matters of civic and general scientific interest. Moreover, the school house as the civic centre would be used for political meetings during campaigns, for polling places on election day, and as headquarters for political or civic improvement associations looking to the betterment of the political and social life of the community, State and nation.

Though the social centre has been approached for some years by the multifarious activities of the New York and other city departments of education, it is only within the past three years that it has become a widespread propaganda. One of the first cities to adopt the idea was Rochester in 1907. This was achieved through the leadership of Edward J. Ward, since then connected with the extension division of the University of Wisconsin. Chicago followed in December, 1910, and has to-day developed the idea on an extensive scale. Under the leadership of Col. E. P. Holland, the Southwestern Social Centre Conference was held at Dallas, Tex., February, 1911, and resulted in an astonishingly rapid and widespread use of school houses for libraries, amusement centres, and civic-betterment activities in city and country in Texas and Oklahoma. The first national conference was held at Madison, Wis., in October, 1911, under the auspices of the extension division of the State University. There resulted The Social Centre Association of America, with Josiah Strong president and Edward G. Ward secretary, and headquarters at 80 Bible House, New York City. The school department of Boston has just undertaken the organization of

four social centres under a special supervisor. Under a new State law authorizing cities to levy a tax of two cents per \$100 assessed valuation for the wider use of school houses, Milwaukee has voted this tax and begun the organization of centres. Numerous other cities which had previously provided playgrounds or other organized recreation, have extended these activities, usually under a special supervisor, until they approach the civic centre. Perhaps the most complete centre is that organized in September, 1912, by the New York Social Centre Committee at Public School 63, on the lower East Side. This has committees in finance, dramatics, moving pictures, music, dancing, debating, public meetings, clubs, festivals, outings, neighborhood social welfare, gymnastics, and lectures. A very striking feature of this movement is that the universities of Kansas, Missouri, Oregon, Texas, Virginia, and Washington have followed that of Wisconsin in leading the development of centres in their respective States.

The second national conference on civic and social centre development was held at Lawrence, Kan., toward the close of the year.

LITERATURE. The Division of Recreation of the Russell Sage Foundation publishes various pamphlets describing wider uses of school houses; Clarence A. Perry of that division has written *Wider Use of School Plants*, covering the entire subject, including evening schools, vacation schools, school playgrounds, public lectures and entertainments, recreation and social centres, athletics, dancing, and games. *The Survey* frequently gives information of the progress of this movement; a new periodical, *The Social Centre*, appeared in November, Osian Lang, editor, Mount Vernon, N. Y.

SOCIAL ECONOMICS. Within the past few years a new department of economic study has been differentiated under the name of social economics. It studies the social aspects of industrial conditions. It is practical, reformative, and socially constructive in its aims. It seeks to establish such conditions for industry as are justifiable from the standpoint of the social welfare of workers and the community. It thus places the human elements in economic life above profits for the employer. Much attention is therefore given to the protection of workers from exploitation through child labor, excessive hours or bad conditions of women workers, unnecessary accidents, insufficient compensation for industrial injuries, occupational diseases, and other conditions. One of its most important principles is the establishment of minimum standards in industry. Thus the social economists favor a minimum wage for women and children; ultimately also for men. Its establishment would raise the plane of competition to a fair and reasonable level; prevent the grasping and conscienceless employer from making profits by exploiting his workers; give the employer who prefers to pay fair wages a better chance; and throw the balance of industrial opportunity in favor of the *entrepreneur* who has superior organizing ability. This same principle applies to almost the entire field. Phases of this subject will be found treated under CHILD LABOR; CHILDREN'S BUREAU; INSURANCE, paragraphs dealing with *Industrial Insurance*; LABOR LEGISLATION; LOAN SHARKS; MINIMUM WAGE; OCCUPATIONAL DISEASES; OLD-AGE PENSIONS; SOCIAL CENTRES; SWEATING; WOMEN IN INDUSTRY; WELFARE WORK;

WIDOWS' PENSIONS; WORKINGMEN'S INSURANCE; WORKMEN'S COMPENSATION.

SOCIAL STANDARDS FOR INDUSTRY. At the 39th National Conference of Charities and Corrections the committee on standards of living and labor presented an outline of living and working conditions considered socially justifiable. Finding that a larger and larger percentage of the population is engaging in industry, the committee insisted that more and more public regulation is necessary in order to protect life, health, and efficiency. It insisted that the community has a right to complete knowledge of industrial conditions and their social effects, in order to establish minimum occupational standards as regards wages, hours, housing, health, and other phases of the relation of labor to industry. Their programme as to wages included a living wage for all engaged in industrial pursuits. Such a wage must provide education, recreation, care for immature members of the family, sickness, and a reasonable provision for old age. Minimum-wage commissions should be established for those industries where women, children, and immigrant men are employed at wages insufficient to maintain a normal standard of living. Moreover, all employers should be required to make detailed public reports of their wage scales, their systems of fining, their bonuses, and all modifications therein. As to hours, this platform provided an 8-hour day for all men engaged in continuous industries, and for women and minors in all industries. It included a six-day week and a weekly rest period of 40 consecutive hours; the prohibition of night work for minors and women, and its minimization for men. As regards safety and health, it provided for a federal investigation into every phase of industrial accidents and occupational diseases, with a view to the establishment of intelligent regulations; and the establishment of such regulations and thorough-going inspection. As to housing, the committee's report declared that the highest social welfare includes for a family the right to a home which shall be safe and sanitary in all respects, and shall cost in rental not to exceed 20 per cent. of the family income. It would transfer a share of the taxes from dwellings to land held for speculative purposes, would abolish home-work and tenement manufacture. As to the term of working life, this programme would prohibit the employment of children under 16, would greatly restrict the employment of women, would introduce supervision and regulation of seasonal trades, and would provide more efficient industrial training. Finally the programme included provision for compensation for industrial accidents and trade diseases; and insurance for old age and unemployment.

SOCIAL INSURANCE IN GREAT BRITAIN. See WORKINGMEN'S INSURANCE.

SOCIALISM. SOCIALISTS AND WAR. During the Balkan War, when it was feared that the great European powers might be drawn into the struggle, the International Socialist Bureau at Brussels issued an appeal to the Socialist organizations of all European countries to arrange for a concerted demonstration on behalf of peace in the capitals and leading cities on November 17. The plan was successfully carried out. The leading Socialist orators addressed meetings in their own and other countries. French and English orators spoke in Berlin, and Russian, Belgian, and German leaders addressed a large gathering of Parisian Socialists, communists, and anarchists. The French Syndicalists, however, as represented by the General Confederation of Labor, took no official part in this demonstration, being opposed to any sort of alliance with Socialists. On November 24 a great International Socialist Congress was held at Basle for the purpose of considering the best means of preventing a general European war. It was attended by 500 delegates representing 21 European countries. The same divergence of views was manifest as in the preceding conferences of Stuttgart and Copenhagen, the French Socialists favoring an anti-militarist programme and a general strike, and the Germans holding that such measures were impracticable, since patriotism would, in the event of war, outweigh all other considerations. The Congress of Basle, which lasted ten days, voted an eloquent resolution against war, but it was couched only in general terms, and like the previous declaration of the Congress of Stuttgart, refrained from urging the specific measures desired by the French, namely, an insurrection of the working classes and a general strike as a protest against war. These measures were not acceptable to the German and Austrian delegates. The view of the latter was that the Socialists were at present not strong enough to prevent war and that the threat of a general strike was foolish. It was idle to suppose that theoretical considerations of remote social advantage would govern men when their country was actually threatened by a hostile invasion. On the other hand, it was argued that if Socialists confined themselves to peace demonstrations and parliamentary protests they would accomplish nothing to the end of averting war. To emphasize the difference between Syndicalists and Socialists the French General Confederation of Labor called a meeting on the same day (November 24) and declared that they were the party of action, not of words. They frankly urged a general strike in case of war, recommended sabotage in the transport and military supply services, and advised men to refuse to obey the call to the colors. They summoned to the Congress workers in the marine, in powder works, arsenals, on the railways, and in other services indispensable

to the government in the event of war. Finally they fixed on December 16 as the date for a twenty-four hours' strike as a foretaste of what would happen if war broke out. The strike took place at the time appointed, but was of little importance. There were no disturbances except at Lyons, and the interruption of work was not serious.

GERMANY. SOCIALISTS IN THE REICHSTAG. Between the years 1881 and 1903 the number of Socialist deputies in the Reichstag rose from 12 to 81. As a result of von Bülow's policy of uniting Liberals, Radicals, and Conservatives against the Socialists and Centre, the number of Socialist deputies fell to 43 in 1907, but this unnatural grouping of parties into a government *blocc* could not survive the dissensions occasioned by the project of fiscal reform. It fell to pieces and the von Bülow government was overthrown, failing to carry through the imperial succession tax. The "blue-black" *blocc* of von Bethmann-Hollweg followed, consisting of the two reactionary groups—Conservatives and Catholic Centre. Indirect taxation was increased. Discontent with this reactionary policy and the high cost of living strengthened the Socialists as the extreme party of opposition, and in the partial elections down to the beginning of 1912 they gained ten seats. Then came the general election of January, 1912 (see GERMANY, Elections), which increased their strength beyond their expectations, giving them a representation in the Reichstag of 110. The popular vote was 4,250,329, a gain of a million votes since 1907. It was an unprecedented victory. It showed that one-third of the entire electorate supported them. Their success was due in part, however, to the help of the Liberals, who for the first time made common cause with them. In the separate Diets the number of Socialist deputies increased from 110 to 224. Although there was great rejoicing among the rank and file of Socialists, their more thoughtful leaders realized that this new-found power seemed greater than it really was. They had drawn to their side temporarily a large number of malcontents of all shades of political opinion, who were certain eventually to fall away, and who were in no sense collectivists. Moreover, there was little unity of view. The party's success was due merely to its gathering to itself those who favored a progressive liberalism. The specific planks in the Socialist platform at the elections were: Democratization of the state and the army, rights of association, professional inspection, popular schools, suppression of indirect taxes, and progressive taxation of incomes, property, and inheritance.

The attitude of the German Socialists toward war was illustrated in 1912, as it had been in the preceding year during the Moroccan negotiations, by the speech of Herr von Vollmar, leader of the Bavarian Socialists in the Bavarian Diet, in August. He said that while the Social Democrats sought always to maintain peace, nevertheless, if their efforts were of no avail, they would surely cast in their lot with the defenders of the Fatherland, postponing all other considerations. The party had been treated by the German government as an enemy, and it refused to express confidence by voting the army estimates, but if occasion arose it would not be found lacking in patriotism.

THE CHEMNITZ CONGRESS. Of the many resolutions presented to the Socialist Congress which met at Chemnitz on September 15, about

one-half concerned domestic matters, as for example the creation of a new presiding body in place of the present one, which was alleged to be unresponsive to the demands of the masses. Others condemned the alliances with the Radicals in the recent elections, declared the hostility of the Socialists to the Church and to religious education, and urged the enlightening of the people by a campaign in the press which should show the incompatibility of religion with scientific truth. The figures presented at the Congress showed an extraordinary increase during the year. The active, enrolled membership in 1912 was reported at nearly a million, an increase of 16 per cent. over 1911, and the number of their daily journals at 86, with 1,500,000 subscribers, an increase of 170,000 over 1911. The great increase in the Reichstag and in the Diets of the empire is noted above. There was a corresponding increase in the municipal governments. The Congress narrowly escaped a break between the Orthodox and Revisionist wings of the party. There was a sharp debate over the heresy of the prominent Socialist, Herr Hildebrandt, who in a recent volume on industrialism had expressed a doubt as to the possibility of nationalizing all production without exception. He was expelled from the party. Herr Bebel was reelected president.

GREAT BRITAIN. COAL MINERS' STRIKE; SOCIALISM AND SYNDICALISM. The miners' strike at the beginning of March (see **GREAT BRITAIN AND STRIKES**), the most serious movement in recent industrial history, aimed apparently at a war of labor against the state. It showed plainly the influence of French Syndicalism and had nothing in common with Socialism. The English Syndicalists, like the French, were bitterly hostile to the parliamentary Socialists. The Labor party were their sworn foes. Mr. Lloyd-George declared that the best policeman for the Syndicalist is the Socialist. A new Syndicalist paper was published in England in January under the title of the *Industrial Syndicalist*, edited by Mr. Guy Bowman and Mr. Tom Mann, of whom the former had lived in France and had translated into English M. Herve's book *Leur Patrie*, and the latter was a well-known labor leader. For mention of their arrest for inciting soliders to mutiny, see **GREAT BRITAIN, History**. From the point of view of the Syndicalists, the miners' strike was the first step toward the general strike. Coal being the essential of all industries, its stoppage would paralyze industrial activity. There was talk of a sympathetic railway strike, and attempts were made to bring about an international movement. A German strike of miners was threatened, but it was merely local and soon put down. French miners planned a strike of 24 hours, and there were other signs of European Syndicalist sympathies. Both wings of the British Socialists, namely, the British Socialist party and the Independent Labor party, attacked Syndicalism at their respective congresses. The Trades Unions (q. v.) in their congress at Newport in September also condemned it. At the British Socialist congress at Manchester, Mr. Hyndman, the leader, reproached both the Labor group and the Syndicalists. He blamed the former for submitting to Liberal domination in Parliament, and for not fighting the battles of class. As to the trade unions, their hope lay not in the path of

Syndicalism, with its contempt for parliamentary action, but in a course that would lead to the conquest of political powers. The ballot, said he, is a more effective instrument than strikes. Socialism, he declared, favored the unions, but its main purpose was to organize the working class into a political party to wrest from capital the control of legislation. Syndicalism, which held aloof from parliamentary action, was denounced by another speaker as merely anarchism under another name. The same views were expressed by the Independent Labor party in its congress at Merthyr. Here, too, it was averred that the ballot was the key to economic liberty and Syndicalists who, like Tom Mann, professed to regard political action as resulting only in measures to deceive the working classes, were condemned. As matters stood it appeared that it was only by allying themselves with the Liberals that the Socialists could hope to maintain their position in Parliament. This was illustrated by the Hanley election in 1912, held for the choice of a successor to Mr. Edwards, a Socialist candidate who had been supported by the Liberals and received over 8000 votes. Now, however, the Liberals and Socialists each put up their candidate, and the Liberals won, the Socialists casting less than one-fourth of the Liberal vote and less than one-third of the Conservative. The London dock strike, whose chief promoter was Ben Tillet, a member of the British Socialist party, was terminated unsuccessfully at the end of July. In the November municipal elections the Socialist parties gained 40 seats.

FRANCE. The ninth annual Congress of the Unified Socialists was held at Lyons February 18-22, 1912. The number of paying members of the party had not increased much and the conditions were not encouraging. The membership of the eighty-six federations was 63,657. The principal issues were: Anti-semitism, free masonry, the agrarian question, the municipal question, and the organization of the young. The chief of these were the agrarian and municipal questions, of which the former presented the usual insoluble problem of reconciling the interests of peasant proprietors and industrial wage-earners. It was deferred to the next congress. As to free masonry, although it was opposed by a number of Socialists as exerting an adverse influence, the congress decided to leave Socialists free to join if they chose. Similarly in regard to the Jews and the Catholics the congress, true to the Marxist principle that religion was a private affair, did not commit itself either to anti-semitism or anti-clericalism. There was some sharp discussion of the proper attitude to take toward the General Confederation of Labor. In December, 1911, two members of the party had denounced in unmeasured terms the methods of the General Confederation of Labor, direct action, sabotage, and violence. There was bitter hostility between French parliamentary Socialists and the Syndicalists, the latter regarding the parliamentary group as merely self-seekers who posed as champions of the proletariat. In general the congress showed sympathy with the deputies who had denounced the General Confederation of Labor in the Chamber, but did not pass any formal vote of approval. It compromised on a vote that left the matter ambiguous, apparently approving, but essentially condemning. The old line of cleavage between the Guesdists

and the party of reform continued. The latter, represented by such men as Jaurès and Vaillant, favored all measures of reform, whether violent or moderate, as likely to undermine the present social system. On the other hand, the Guesdists, doctrinaire and imbued with German notions, regard all reforms as useless in a capitalistic society and aim solely at a political revolution. Hence they desire the conquest of political powers by the ballot, by discipline, recruiting, stirring up the masses, and the subordination of the General Confederation of Labor. The two groups are apparently irreconcilable. The congress did nothing to bring them together and was in other respects as well rather barren of results. The hostility of the Syndicalists toward the Socialists was as bitter as ever and was shown on many occasions. Syndicalists who had taken part with M. Hervé in founding his journal, the *Social War*, accused him of treason in inclining too far toward Socialism. The General Confederation of Labor, the great central organ of Syndicalism, issued a manifesto declaring its hostility to Socialists, whether followers of M. Jaurès or M. Hervé.

ITALY. As was noted in the YEAR BOOK for 1911, Italian Socialists were divided on the question of the war with Turkey and on the question of supporting the Giolitti ministry when it came into power. A branch of the party favored participation in the government, despite the vote of the Socialist Congress against it, and Signors Bissolati, Cabrini, and Bonomi would have accepted portfolios in the new cabinet had it not been for the opposition of the majority. Although the Socialists in the Chamber voted unanimously against the government's decree annexing the North African provinces, a considerable portion of the party declared in favor of the war, and many Socialists holding office in the municipalities subscribed to funds in aid of the war and took part in patriotic demonstrations on its behalf. The thirteenth congress of the Italian Socialists was held at Reggio Emilia in the summer of 1912. Signor Bissolati favored a programme of gradual conquest of political power by active participation in government. To this Signor Turati and the other reformers of the Left who remained in the party were opposed, contending that changes should be brought about by popular pressure without compromising with a capitalist government. They corresponded to the Guesdist group in France. The preponderant element in the original party consisted of revolutionists who differed from Signor Turati on the question of electoral alliances. The new Socialist group began an active campaign and won many adherents. In the Chamber thirteen deputies joined the new party, while twelve remained faithful to the old. The question of the status of the dissident deputies immediately arose and they finally decided to send a circular letter to the electors asking whether they continued to regard them as their representatives. The executive committee of the old party referred the matter to the International Socialist Bureau at Brussels, declaring that the new group had split off on principles at variance with those of the International, were endangering the unity of the proletariat, etc.

BELGIUM. The defeat of the Liberal Social alliance in the elections of June has been noted under BELGIUM, *History*. The reverse was com-

plete and unexpected and was characterized by Belgian Socialist journals as a blow at free thought and international socialism. The Socialists refused to acknowledge their defeat as an expression of the popular will, contending that under the present electoral system the majority did not represent the people. Soon after the elections the Walloon coal miners in the region of Charleroi went on strike. The Socialists discouraged the movement as premature, but held a congress at Brussels July 3-9 for the purpose of organizing a general strike to force the hand of the government if it refused to submit to the Chamber in November an amendment to the constitution providing for universal suffrage and for the abandonment of the system of plural voting. The congress was attended by 1500 delegates, including 20 deputies and 4 senators. It decided upon a general strike, leaving its date uncertain in order to take the government by surprise. It was marked by unanimity and enthusiasm, and its programme was carried out in an orderly fashion. Great stress was laid on the necessity of regarding the law and abstaining from all acts of violence. Trades unions, cooperative societies, and other workingmen's bodies were urged to side with the Socialists and to supply the sinews of war. Commissions of the general strike were formed, local committees promptly came into existence, and a national subscription was opened. Monster meetings were held and addressed by prominent Socialist orators, like MM. Vandervelde, Anseele, Destree, and others. The national committee on the electoral law and the general strike circulated a million copies of a manifesto to the effect that the plural vote reduced the working classes to a minority, that the country really desired universal suffrage, that the Clericals would not dare to combat it openly, etc. It also declared that the strike to be successful must last five or six weeks. The enormous losses this would entail on the working population were plainly pointed out, but it seemed not to dampen their ardor. Much alarm was felt lest, despite the efforts of its organizers, the strike should degenerate into a riot.

OTHER COUNTRIES. In Spain the Socialist party has recently made rapid progress. In 1888 it comprised only 16 associations. In 1912 the number of these bodies had risen to 216 without counting the 55 associations of the so-called Young Socialist party. They published fifteen journals. In Denmark, where the Social Democrats are the largest political group, there were reported to be one thousand Socialists on the provincial council in 1912. They gained another seat in the Copenhagen municipal election of that year, giving them exactly half of the seats in the council. The party published thirty-two newspapers. In the Netherlands the membership of the Social Democratic party was reported at 13,398 in 1912, a considerable increase over the previous year. In Norway the Socialists had 23 seats in Parliament after the general election of November, a gain of 13, and their popular vote rose from 91,000 to 126,000. In Russia the Social Democratic party showed increasing strength in 1912, although owing to the rigid measures taken by the government (see RUSSIA, *History*) they elected only twelve members to the fourth Duma.

For an account of the Socialist strength in the United States see PRESIDENTIAL CAMPAIGN,

paragraph *Elections*, and for the Socialist programme see the same article, paragraph *Platforms*; for municipal elections see MONTANA and WISCONSIN under *Politics and Government*; and for Socialism in American cities, see MUNICIPAL LEAGUE, NATIONAL.

SOCIALIST PARTY. See PRESIDENTIAL CAMPAIGN.

SOCIAL SERVICE, AMERICAN INSTITUTE OF. An organization founded in 1898 for the purpose of gathering and disseminating information on all branches of social thought and service. It supplies information and advises as to methods by correspondence. Its publications, lectures, and special reference library are open to the public. Its service is free except when special investigations are required. Series of illustrated lectures on industrial problems prepared especially for use in churches are being widely circulated. *The Gospel of the Kingdom*, published monthly by the institute, containing studies in the application of Christian principles to present-day problems, is used by classes in churches, Y. M. C. A.'s, etc., in all parts of the United States and Canada. For the 1913 series, containing special articles and bibliographies in the "What To Do" department, the following subjects were selected for treatment: Poverty, Wealth, Socialism, Eugenics, Euthenics, The Unfit, Rural Communities, the Mormon Menace, The Coming Church, Moral Training in the Public Schools, The Unemployed, and Peace.

SOCIOLOGICAL SOCIETY, AMERICAN. See SOCIOLOGY.

SOCIOLOGY. Various articles of sociological interest will be found under their respective headings. Matter relating to the condition of labor is referred to under LABOR; of special interest to the sociologist are CHILD LABOR, MINIMUM WAGE, WOMEN IN INDUSTRY, OCCUPATIONAL DISEASES, INDUSTRIAL WORKERS OF THE WORLD, SYNDICALISM, WELFARE WORK, and WORKINGMEN'S INSURANCE. Renewed interest in divorce during the year was due to the report of the English commission, for which see DIVORCE. Under PENOLOGY is a brief summary of changes occurring in the treatment of prisoners. See also the topics referred to under SOCIAL ECONOMICS.

THE AMERICAN SOCIOLOGICAL SOCIETY. The seventh annual meeting of this society was held at Boston, December 27-31, in connection with the American Economic Association, the American Statistical Association, and other bodies of kindred interest. The various papers on the programme of the society centred about the changes which have been wrought in the various social sciences as a result of the development of the social idea. The president, Albion W. Small of Chicago, read a paper on "The Present Outlook of Social Science." The unity of the programme is shown by the list of other papers: "Social Phases of Psychology" by President G. Stanley Hall of Clark University; "Social Aspects of Educational Theory," by Paul Munroe of Teachers College; "Social Phases of the Historical Method," by Carl L. Becker of the University of Kansas; "The Outlook for a Régime of Social Politics in the United States," by C. E. Merriam, of the University of Chicago; "Legislation as a Social Function," by Roscoe Pound of Harvard Law School; "Social Implications of Remedial and Preventive Legislation

in the United States," by E. R. James of the University of Wisconsin Law School; "Social Ideals Implied in Present American Programmes of Voluntary Philanthropy," by Edward T. Devine of Columbia University; "The Socialization of Religion," by Francis G. Peabody of Harvard Divinity School; a symposium on "The Social Presuppositions of English and American Economic Theory"; and a round table meeting on "How far is it possible to go in constructing a platform of social theory acceptable to all American sociologists?" Following the custom of the society of a two-year term for its officers, Albion W. Small was re-elected president and S. E. W. Bedford, also of Chicago University, secretary-treasurer.

BIBLIOGRAPHY. The volume of distinctively sociological literature put out in 1912 was unusually small. Among books of interest were the following: G. Richard, *La sociologie générale et les lois sociologiques*; H. Webster, *Rest days: a sociological study*; Thomas Nixon Carver, *The Religion Worth Having*; E. J. Urwick, *A philosophy of social progress*; F. Consentini, *Sociologia: genesi ed evoluzione dei fenomeni sociali*; S. B. Kitchin, *A history of divorce*; J. Q. Sealey, *The family in its sociological aspects*; Lucien Arreat, *Génie individuel et contrainte sociale*; S. N. Patten, *The social basis of religion*; G. Chatterton-Hill, *Sociological value of christianity: Papers and proceedings of the sixth annual meeting of the American Sociological Society at Washington, D. C., 1911*; C. A. Elwood, *Sociology in its psychological aspects*; F. S. Granger, *Historical sociology*; Walter Rauschenbush, *Christianizing the social order*; J. G. Frazer, *The golden bough*, 3d ed.

EUGENICS. W. E. Kellicott, *The social direction of human evolution*; Castle and others, *Heredity and eugenics*; C. B. Davenport, *Heredity in relation to eugenics*, (1911); Papers communicated to the First International Eugenics Congress held at the University of London, July 24-30, 1912, *Problems in eugenics*; K. Pearson, *Social problems: their treatment, past, present and future*; W. Bateson, *Biological fact and the structure of society*; O. C. Beale, *Racial decay*; M. S. Iseman, *Race suicide*; W. C. D. and C. D. Whetham, *An introduction to eugenics*; Arthur Newsholme, *The declining birth-rate: its national and international significance* (1911); René Worms, *La sexualité dans les naissances françaises*; Henry H. Goddard, *The Kallikak family*; L. H. Baker, *Race improvement*; G. E. Dawson, *Right of the child to be well-born*; C. W. Saleeby, *Methods of race-regeneration*; Vernon L. Kellogg, *Beyond War*.

SOIL ORGANISMS. See BIOLOGY.

SOILS. There is evidence that the influence of the comprehensive and consistent study of soils in the United States is having an effect on practice for, as Secretary Wilson says in his last report (1912), "beginnings have been made in a production increasing faster than the natural increase of population."

SOIL SURVEYS. The proper basis for the improvement of methods of soil management is an accurate and comprehensive soil survey. Such surveys are now available for all parts of the United States. Up to June 30, 1912, the total area surveyed and mapped by the United States Bureau of Soils was 622,595 sq. m., or 398,460,800 acres. "It is probable that all the widely distributed and important soils in the country have been encountered and iden-

tified in one or more places." Interest and activity in soil surveying is becoming quite general throughout the world and work of this kind was reported in 1912 from Russia, Australia, New Zealand, Java, Africa, South America, and Cuba, but in no case was the work as systematic and comprehensive as that in the United States.

As the work of soil surveying extends, questions of soil classification become increasingly important and are engaging more and more attention. Congress at its last session passed a law providing for a practical application of such work in the classification of the lands included within the national forests, with a view to delimiting those of agricultural value.

SCIENTIFIC INVESTIGATIONS. That the study of soils is engaging the attention of an increasing number of scientific men is shown by the fact that a large number of papers dealing with various scientific aspects of soil problems were presented at the Eighth International Congress of Applied Chemistry, held during the year at New York. These papers emphasized especially the complex composition of soils and the delicate balance which must be maintained between soil constituents in order to insure fertility. See also **FERTILIZERS**.

The United States Bureau of Soils added some twenty new compounds to the fifteen which it had already isolated from the organic matter of the soil. These represent nearly every chemical class of organic substance. Progress was also made in studying the effect of these compounds on the growth of plants and on the biochemical changes which take place in soils. Jodidi of the Iowa Experiment Station made further important contributions to the transformation of the organic nitrogenous compounds of the soil. Studies of these compounds, as well as of various mineral constituents usually occurring in relatively small amounts and hitherto considered of minor importance, are beginning to throw light upon many problems of soil fertility and of the use of fertilizers. They show that comparatively small variations in amount or relative proportion of the soil constituents may have a profound effect upon the productiveness of the soil as determined by physical, chemical, and biological properties. The investigations of the past year emphasize the close relation between bacterial activities and crop-producing power of soils. They show more clearly than ever before that soil constituents are transformed, absorbed, and fixed by bacterial action as well as by chemical and physical action. Stoklasa has shown, for example, that a large amount of carbon dioxide is produced in fertile soils by the respiration processes of soil bacteria and that this exerts a pronounced influence on the physical condition and the chemical composition of the soil. That these processes are most active in fertile soils supports Hall's conclusion that high productiveness is accompanied by high waste, the latter being due largely to bacteria which attack the nitrogen compounds of the soil and liberate free nitrogen. The wasteful processes can apparently be partly controlled by partial sterilization, by heat or antiseptics, and possibly by other means. A practical problem of great importance, therefore, is to devise methods of sterilization which can be economically applied in large scale field operations. Practical methods applicable to

greenhouses and other small-scale operations have been in use for some years. It has been shown that by use of sterilization (heating to 200° F.) the expensive process of renewing green house soils may be obviated, the productiveness increased, and the danger from disease reduced.

Investigations reported during the year emphasize the important fact that there is considerable bacterial activity even in frozen soils, although the growth is confined largely to one group, which, however, includes those of most importance from the standpoint of soil fertility. The investigations of Hilgard and Loughridge, showing that soils of arid regions differ from those of humid regions, in the greater uniformity in physical and chemical composition of the former to a great depth, have recently been supplemented by work by C. B. Lipman, of the California Experiment Station, and others, indicating that bacteria are more active and occur to a greater depth in soils of the arid regions than in those of humid regions, a fact which doubtless accounts in part for the greater fertility of the arid soils. Lipman has also shown that the common alkali salts have a toxic effect on the ammonifying, nitrifying, and nitrogen-fixing organisms of the soil. W. P. Kelley found that 5 to 10 per cent. of manganese oxid in Hawaiian soils had no effect upon ammonification or nitrification, although causing pronounced chlorosis in pineapples. Since, according to Hall, the problem of maintaining soil fertility is largely a matter of preventing loss of nitrogen and insuring a high nitrogen content of the soil, it is important to know that the practice in China and Japan and experiments conducted by the Illinois and Rhode Island stations and by others show that the nitrogen supply of the soil may be maintained without recourse to fertilizers. In experiments at the Rhode Island station soils gained one ton of nitrogen per acre in five years, with a rotation including such leguminous plants as cowpeas, soy beans, and vetch.

LITERATURE. The most important recent contribution to the permanent literature of soils is *The Black Soils, or Chernozem of Russia*, by P. Kossovich, which deals in detail and with great thoroughness with these noted soils analogous in many respects with much of the prairie and dry lands of the western United States. The Bureau of Soils has undertaken a series of monographs which will summarize for each group and type of soil all the information secured by its soil surveys.

SOKOTRA. A dependency of Aden (q. v.).

SOLAR ECLIPSES. See **ASTRONOMY**.

SOLAR RADIATION. See **ASTRONOMY**.

SORSBY, WILLIAM BROOKS. An American diplomat, died March 27, 1912. He was born in Panola, Miss., in 1858 and was educated in private schools and at the Mississippi College. He engaged in journalism and edited several country newspapers in that city. In 1884 he became part owner of the *Mobile Morning Telegram*. In 1893 he became interested in gold mining in Ecuador. He was consul general in that country from 1899 to 1893. From 1897 to 1901 he was consul at San Juan del Norte, Nicaragua, and at Kingston, Jamaica, in 1901-2. In the latter year he was appointed United States minister to Bolivia. He re-

tained this office until 1909 when he resigned and left the diplomatic service.

SOUTH, UNIVERSITY OF THE. An institution for higher education at Sewanee, Tenn., under the auspices of the Protestant Episcopal denomination, founded in 1857. The enrollment in the various departments of the university in the autumn of 1912 was 246. The faculty numbered 27. Among the important changes in the faculty were the resignation of the Rev. Henry R. Gummey, professor of ecclesiastical history and polity, and the appointment as his successor of the Rev. Thomas Allen Tidball, and the appointment of Thomas Nottingham Ware, professor of modern languages, in the place of Glen Levin Swigget. Professor Gummey was elected professor emeritus. The benefactions received during the year amounted to \$17,437. The productive funds of the university amount to \$351,383. The income for 1911-12 was \$84,916. The library contains 33,731 volumes. Vice-chancellor, William B. Hall.

SOUTH AFRICA, UNION OF. A British colony; a legislative union, under one government, of four British provinces. Their areas according to latest returns, total population (census of May 7, 1911), and their white population (census 1911) are shown in the following table:

	Sq. miles.	Total pop.	Whites
Cape of Good Hope.....	206,860	1,553,630	546,162
Bechuanaland	51,524	99,553	14,917
Transkeian Territories:			
East Griqualand	7,594	249,088	7,950
Tembuland.	4,129	236,086	8,138
Transkei	2,552	188,895	2,189
Pondoland	3,906	234,637	1,383
Walfish Bay	430	637	32
Total Cape Province.	276,995	2,564,965	582,377
Natal	24,866	974,437	95,994
Zululand	10,424	219,606	2,120
Total Natal	35,290	1,194,043	98,114
Transvaal	110,426	1,686,212	420,562
Orange Free State..	50,389	528,174	176,189
Total Union of South Africa	478,100	5,973,394	1,276,242

Of the total population, 3,069,392 were males, 2,904,002 females; of the total whites (who numbered 21.37 per cent. of the total population), 685,164 were males and 591,078 females. The Bantus numbered 4,019,006 (2,022,949 males and 1,996,057 females), or 67.28 per cent. of the total population; mixed and other colored, 678,146, or 11.35 per cent. Density per square mile for the Union, 12.63 (Cape of Good Hope, 9.26; Natal, 33.83; Transvaal, 15.27; Orange Free State, 10.48). The total population in 1904 was 5,175,824.

The South Africa act provided that elementary education shall remain under the jurisdiction of the several provincial councils for "five years and thereafter until Parliament otherwise provides."

MINING. The Union of South Africa stands first among the countries of the world in the production of gold and diamonds. Other mineral products are coal, copper, tin, asbestos, graphite, magnesite, zinc, lime, salt, etc. The number of white and colored laborers employed (December 1910) and value of the output for the year 1910 are shown by provinces in the following table:

	Laborers		Output £
	White	Colored	
Transvaal	27,891	219,610	35,426,586
Cape Province	5,034	17,465	5,777,010
Orange Free State.....	1,473	11,966	1,667,802
Natal	579	9,901	710,535
Total Union	34,977	268,932	43,581,933

Gold. The gold produced in the Transvaal amounted (1910) to more than one-third of the world's supply. Of the 26,198 whites employed in the gold mines of the Union in June, 1911, 26,159 were in the Transvaal, 25 in Natal, 12 in the Orange Free State, and 2 in the Cape province; of the 208,182 colored laborers, 207,907 were in the Transvaal, 216 in Natal, 46 in the Orange Free State, and 13 in the Cape province. The total output for the Union in 1910 was £31,991,295 (world's output 1910, £93,500,000), of which the Transvaal furnished £31,973,123 (from the Witwatersrand mines, £30,653,933), or 7,527,108 fine ounces. The total output for 1909 was £30,994,905, of which £30,987,650 came from the Transvaal (contribution of the Witwatersrand mines, £29,787,569).

Diamonds. In June, 1911, 4723 whites were employed in the diamond mines (Cape, 2830; Orange Free State, 1096; Transvaal, 797) and 39,884 colored (Cape, 18,004; Transvaal, 11,254; Orange Free State, 10,626), besides several thousand individual diggers. The output for the year 1910 was 5,466,557 carats, valued at £8,101,363 (Cape, 2,586,294 kts., £5,267,659; Orange Free State, 780,195 kts., £1,505,074; Transvaal, 2,090,068 kts., £1,328,630). The value of the stones obtained from the Cape and Orange Free State mines is greatly in excess of that of the Transvaal diamonds, the latter selling at one time for 13 shillings per carat when the former were averaging from 42s. to 36s.

Coal. White and colored labor employed in coal mines in June, 1911, 1237 and 23,440, respectively (Natal, 517 and 11,248; Transvaal, 504 and 9399; Orange Free State, 101 and 1600; Cape, 115 and 1193). The output in 1910 and the pit's mouth value of the total production to the end of 1910 are given below:

	1910		Total £
	Tons	£	
Transvaal	3,974,376	987,260	11,722,988
Natal	2,570,115	688,424	6,849,285*
O. F. S.....	469,762	131,728	867,498
Cape	93,280	59,808	2,131,307
Total Union	7,107,533	1,867,220	21,591,078

* From 1903 only.

The Cape province, having less competition, obtains higher prices than the other provinces. Better qualities are found in Natal and the Transvaal. Most of the supply from Natal is bunkered at Durban or exported, while the mines, railways, and other local industries consume much of that produced by the other provinces.

Other Minerals. Of the other mining products, only tin and copper are exploited in commercial quantities, largely in the Transvaal and Cape provinces. Output of tin in 1910, £326,352 (Transvaal, £324,559; Cape, £1793); of copper, £477,381 (Cape, £401,206; Transvaal, £76,175). Value of cement, bricks, pottery, etc., produced

in 1910, £489,268; of silver contained in export of gold bullion, £90,790. A total of 582 whites and 7058 colored were employed in the miscellaneous mines in June, 1911.

OTHER INDUSTRIES. There is an efficient agricultural department, which has established agricultural colleges and experiment stations. Ostrich and sheep farming are important industries. Corn was produced for export in 1910 to the value of £693,413 (178,000 tons); wool, £3,830,914 (121,672,255 lbs.); tea, 2,092,000 lbs.; sugar, 82,000 tons; whale oil (from the whaling station at Durban), £60,000; wattle bark, £219,433 (41,344 tons). The ostrich-feather production had a selling value of about £6,000,000. Manufactures are making progress.

COMMERCE AND COMMUNICATIONS. For 1910 statistics of trade by provinces are not available; as, in consequence of the formation of the Union (May 31, 1910), only the totals were given in the original returns. The total imports (including bullion and specie) into the Union of South Africa, together with Swaziland, Basutoland, and Bechuanaland Protectorate, during the year 1910 were valued at £41,430,037 (of which £4,703,207 bullion and specie); £24,002,537 was from the United Kingdom. The total exports were valued at £56,428,455 (£34,608,381 bullion and specie), of which exports to the United Kingdom were valued at £49,998,413. Preliminary returns place the imports and exports for 1911 at £36,925,384 and £57,024,000, respectively, exclusive of specie.

The table below gives trade by provinces (or, as they were previous to 1910, colonies) for three years, including bullion and specie. Figures for bullion and specie are given separately for 1909 in the last column.

	1907	1908	1909	B. & S.
Nat. a	£ 7,737,750	£ 7,034,422	£ 8,225,792	£ 601,192
Nat. b	3,293,875	3,159,523	3,951,092	1,135,991
Cape a	15,599,955	13,767,158	14,821,158	212,229
Cape b	44,536,729	42,140,459	46,598,993	32,201,958
O.F.S. a	3,672,591	2,946,860	3,662,696	238,307
O.F.S. b	3,751,049	3,558,373	4,777,126	72,833
Trans. a	15,760,987	16,196,692	19,643,615	2,178,703
Trans. b	31,268,276	33,323,590	34,128,956	30,999,649

a = imports; b = exports.

The government in 1910 owned and operated 7041 miles of railways, and 545 miles were owned and operated by private companies. The receipts from government lines amounted to £12,056,871 and the working expenditure to £6,597,911. Construction proceeded on the following lines during 1912: Port Elizabeth to Avontuur; Ceres Road to Ceres; George to Oudtshoorn; Lady Grey to Gairtney; Llewellyn to Franklin; India Junction to Alberton; Coomatipoort to Tzaneen; Umlaas Road to Mid Illovo; and on the Howick Railway. These for the most part were short lengths. During 1912 the connection between Zeerust and the Rhodesian system at Mafeking was under construction, reducing the distance between Johannesburg and Bulawayo by 250 miles. There are 47,421 miles of telegraph wires and 38,832 of telephone wires; telegraph offices, 1231. There is cable connection with Europe, Australia, India, and the Far East; two wireless stations have been established, one at Cape Town and one at Durban. Railway lines under construction, 859 miles.

SHIPPING. Shipping entered 1909, 9,857,081 tons; 1910, 11,494,855 tons.

ARMY. An energetic campaign, as a result of the Defense act of 1912 prepared by General Smuts, with the advice of Lord Methuen, was undertaken with the aim of "establishing in South Africa an adequate system of national defense, which will recognize the application of the citizen to take part in the defense of his country." This act provided for liability to military service in any part of South Africa upon the whole white male population up to the age of 60, and the formation of an Active Citizen Force of 20,000 to 25,000 men, with a reserve up to the age of 45. This was being organized so that it would come into existence by July 1, 1913. Every youth must undergo military training as a cadet, except upon conscientious objections, and in the rural districts they must join rifle associations and get some military training in that way. The Active Citizen Force arranged to provide for four annual trainings of about 50 per cent. of the young men between the ages of 21 and 25, and every effort was being made to increase volunteering in the joining of rifle clubs. The permanent force for the Union was to consist of 2500 mounted riflemen, divided into 5 regiments, many of whom were already on police duty, and 5 field batteries. The men on police duty would be relieved by a reserve. On July 1, 1912, a military school was opened at Bloemfontein for the instruction of future district officers and adjutants. The first class was composed of 40 staff officers, all of whom had war experience. The course was to last for six months.

FINANCE AND GOVERNMENT. Financial statistics are given separately in the articles on the various provinces.

The four original provinces form a legislative union under one head—a governor-general appointed by the crown, who, with an executive council (whose members are chosen by him), administers the country as the governor-general in council. Forty members make up the Senate (eight nominated by the governor-general in council; thirty-two elected, eight for each province). Fifty-one members from the Cape of Good Hope, 17 from Natal, 36 from the Transvaal, and 17 from the Orange Free State compose the House of Assembly. Pretoria (Transvaal) is the capital and administrative headquarters; Cape Town, the seat of the legislature. The governor-general in 1912 was Viscount Gladstone of Lanark. General Louis Botha, premier since May 31, 1910, resigned December 14, 1912, on account of dissensions between the Dutch and the British on naval and other matters.

HISTORY

THE PARLIAMENTARY SESSION. The Union Parliament was opened on January 26. In the speech from the throne the government policy was briefly outlined as including the necessity of adequate defense legislation, of customs revision, of the promotion of local industries, and of legislation as to the regulation of railway and other public services, land settlement, irrigation, the establishment of a Union land bank, railway development, agricultural development, a national university, restriction of immigration, etc. A comparatively small portion of this programme had been carried out at the close of the session toward the end of June.

The chief measures passed were the Defense act, the Railway Service act, the Miners' Phthisis act, the Public Services act and the measures dealing with land settlement, irrigation, and a land bank. The Immigration Restriction bill, though pressed by the government early in the session, failed of passage, as did the Financial Relations bill and the University bill. In outlining the government's policy as to lands, General Botha declared that the crown lands should first be used for settlement, and that then other land would be purchased for that purpose. The government would also render aid to the poor whites in South Africa and would then use what money was left over for assisting immigration. He denied that immigration was in any way discouraged. The Defense bill was substantially the same as had been anticipated in the previous year. Its chief defect, according to the opposition, was the danger of arbitrary action on the part of the government in view of the great power that it conferred upon it. Other critics expressed the fear that the citizens' force might be engaged outside South Africa, and officered from outside, that the period of training might be unduly prolonged, and that the compulsory cadet system might be applied in the thinly settled districts. The government met these objections by saying that they arose from a misunderstanding of the measure. In its final shape, however, it was as much the work of the opposition as of the government. This was true also of the Irrigation and the Miners' Phthisis bills. The session revealed a lack of harmony and consequent weakness in the ministry, and on June 26, to avert a cabinet crisis, the portfolios were redistributed.

RACE QUESTIONS. The Immigration Restriction bill mentioned above had been framed after a long correspondence between the imperial and Union governments and was designed to meet the objections of the home government and of the Indians to the existing methods of restriction. The immigration bill of the previous year, whose chief feature was the replacing of the racial qualifications by an educational test, had been withdrawn for lack of time, but the government had promised the Indians to bring in a new measure and meanwhile to relax their restrictions. The new bill was introduced in May, 1912, but failed of passage. In October the leader of the Indian Progressives, Mr. Gokhale, visited South Africa for the purpose of studying on the spot the question of the treatment of the Indians. Another racial question concerned the so-called "black peril." There was much discussion of this in the early part of the year owing to the frequency of outrages on white women committed by the negroes in recent years. Conditions resembling those prevailing in some of the Southern States of the United States were reported, and early in May the government decided to appoint a commission of inquiry. Finally the old question of the language to be used in teaching in the schools continued to absorb attention. The provincial councils of the Cape, Transvaal, and the Orange Free State passed ordinances establishing equality between the English and Dutch languages in the schools, but providing for instruction in the mother tongue in the "junior standard." These ordinances were ostensibly based on the compromise proposed in the parliamentary report of 1911, but the Unionists

declared that they had been so greatly modified as to depart altogether from the spirit of that compromise. On this ground a similar ordinance in Natal was projected.

THE MINISTRY. The conciliatory policy toward the government was abandoned by the leader of the opposition, Sir Starr Jameson, who early in the year strongly opposed the government's plan for reorganizing the civil service. In April he was succeeded in the leadership by Sir Thomas Smartt. The government was also embarrassed by differences among its own members. In May Mr. Hull, the minister of finance, resigned on account of differences with Mr. Sauer, minister of railways, and when the affair was discussed in parliament it brought the government to the verge of a crisis and led to a redistribution of portfolios on June 26, as noted above. In the latter part of the year differences between General Botha and General Hertzog, the anti-imperialist leader, led to the resignation of the former on December 14. He was at once asked, however, to form a new cabinet.

SOUTH AFRICAN IRRIGATION ASSOCIATION. See IRRIGATION.

SOUTH AUSTRALIA. A state of the Commonwealth of Australia. Area, 380,070 square miles. Population (census of April 3, 1911), 408,558, exclusive of full-blooded aborigines. Adelaide, the capital, had 42,294 inhabitants; with suburbs, 189,646. Governor in 1912, Admiral Sir Day Hord Bosanquet; premier, A. H. Peake. See AUSTRALIA.

SOUTH CAROLINA. POPULATION. According to the Census Bureau statistics compiled during 1912, out of a total population of 1,515,400, 6054 were foreign-born whites, compared with 5371 in 1900. Of these foreign-born whites, 1739 came from Germany, 785 from Russia, 675 from Ireland, 504 from England. Other European countries are represented by smaller numbers. The negroes in the State in 1910 numbered 835,843 and the mulattoes 134,381. In 1890 the negroes numbered 688,934 and the mulattoes 67,153. It will be seen from these figures that the negro and mulatto population in the State exceeds the white.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1912 are shown in the table below.

		Acreage	Prod. Bu.	Value
Corn	1912	1,915,000	34,278,000	\$29,126,000
	1911	1,790,000	32,578,000	29,646,000
Wheat	1912	79,000	727,000	865,000
	1911	83,000	946,000	1,164,000
Oats	1912	324,000	6,966,000	4,598,000
	1911	346,000	7,038,000	5,067,000

MANUFACTURES. The Thirteenth Census included statistics of manufactures in the State. These are for the calendar year 1909. The most important general results are shown in the table below. The industries in which the

largest number of wage earners were employed and the value of product greatest were those connected with cotton goods. In these industries the wage earners numbered 45,454 and the product was valued at \$65,930,000. Next in point of importance were the industries connected with lumber and timber products. In these, 14,604 wage earners were employed and the product was valued at \$13,141,000. The only other two industries of great importance were those connected with oil, cottonseed and cake, and fertilizers. The total number of wage earners in the State in 1909 was 73,046. Of these, 9405 were under 16 years of age, 3989 of these being females. For the great majority of wage earners in the State the prevailing hours of labor are 60 a week. The largest number of wage earners are in Charleston, 2874; in Columbia, 2522; in Spartanburg, 1773, and in Greenville, 1182.

	Number or Amount 1909	1904	P. C. of Inc. 1904-09
Number of establishments	1,854	1,399	82.5
Persons engaged in manufactures ..	78,040	62,071	23.7
Proprietors & firm members	1,737	1,241	40.0
Salaried employees	3,257	2,389	36.3
Wage earners (average No.)....	73,046	59,441	22.9
Primary horsepower.....	276,378	197,479	40.0
Capital	\$173,221,000	\$113,422,000	52.7
Expenses	97,371,000	72,206,000	34.9
Services	24,117,000	16,224,000	48.6
Salaries	3,756,000	2,355,000	59.5
Wages	20,361,000	13,869,000	46.8
Materials	66,351,000	49,969,000	32.8
Miscellaneous	6,903,000	6,013,000	14.8
Value of products ..	113,236,000	79,376,000	42.7
Value added by manufacture (value of products less cost of materials)....	46,885,000	29,407,000	59.4

FINANCE. The total receipts during the fiscal year 1911 amounted to \$3,208,790. There was a cash balance December 31, 1910, of \$648,730. The expenditures for the fiscal year amounted to \$3,132,164, leaving a cash balance at the end of the fiscal year, December 31, 1911, of \$725,356. The chief receipts were from general taxes, from insurance license fees, and from the fertilizer tax. The chief expenditures were for the support of State institutions, education, and the administration of State government.

CHARITIES AND CORRECTIONS. The institutions under the control of the State are the State Hospital for the Insane, the South Carolina Industrial School, the Infirmary for Colored Veterans, the deaf, dumb, and blind institutions, and the State prisons.

POLITICS AND GOVERNMENT

The legislature was in session in 1912 and the most important enactments will be found in the paragraph *Legislation* below. Elections for governor and other State officers and senatorial primaries were held during the year. The full Democratic State, county, and federal tickets were elected by the usual majorities.

The Democratic State convention on May 16 indorsed Woodrow Wilson for President. The Republican delegates-at-large were instructed for President Taft, the district delegates being divided. On July 24 the national Progressive party held a convention in which nine delegates were elected to the national Progressive convention in Chicago.

Governor Coleman L. Blease was much in the public eye during 1912. In his annual message to the legislature he took a strong stand against negro education and urged a law to prevent white persons teaching negroes. He also indirectly defended lynching and recommended the adoption of a law prohibiting negroes from secret societies. Investigations carried on by detectives during the year on behalf of the investigating committee of the legislature resulted in the publication of charges of corruption against Governor Blease. These charges related to pardons, and it was alleged that Governor Blease had received large sums for pardoning convicts. It was also alleged that Blease's appointee as liquor constable in Charleston was transmitting "graft" to men higher up. On July 20 Governor Blease replied in detail to the charges made against him, denying them and expressing contempt for those who brought them. In spite of an apparently strong feeling against him throughout the State he was renominated for the second term on August 28. He was opposed by Ira B. Jones, a former chief justice of the State Supreme Court, who had resigned his position on the bench for the purpose of contesting the nomination against Governor Blease. The result of the election (held August 27) was 67,240 votes for Blease and 64,072 for Jones. Senator Tillman was renominated at this election. A committee of the legislature conducted an investigation into the returns of the election, chiefly to determine whether the charges of fraud could be sustained. The committee at the same time investigated the general charges of corruption against Governor Blease. The executive committee of the Democratic party examined into the charges of fraud in the primary election, but found the evidence insufficient to vitiate the choice of Governor Blease as a candidate for reelection. On August 24 Senator Tillman issued an appeal to defeat Governor Blease for the second term. He said: "I have become convinced of the unfitness of Blease to be governor. The State has been disgraced in the eyes of the world and its good name made a by-word and a hissing. No one can redeem it except its own people. I implore the people to take care of the State's good name next Tuesday."

On September 4 the Democratic State committee met to canvass the returns of the primary and decided to make a thorough and sweeping investigation of all the charges of fraud and irregularity. On October 1 this committee reported that the allegations of fraud could not be sustained and Governor Blease was thereupon made the Democratic candidate, which was equivalent to election. Governor Blease won still more notoriety by addresses delivered before the governors' conference in Virginia in the first week of December. He made bitter speeches against negroes and again defended lynching under certain conditions. His addresses were bitterly resented by the other governors present at the conference. Later in the month Governor Blease pardoned or paroled seventy-nine convicts. He had declared at the governors' conference his intention of pardoning at least 800. His total for pardons and paroles, including the 79 issued the day before Christmas, reached 506 in the two years of his first administration. The result of the election on November 5 was as

follows: For President, Wilson received 48,355 votes, Roosevelt 1293, Taft 536, and Debs 164. Wilson's plurality was 47,064. For governor, Blease received 44,122, and Britton, Socialist, 208. There was no Republican candidate as the Republican party practically does not exist in South Carolina.

LEGISLATION. The legislative session of 1912 was marked by disagreement between the legislators and the governor. As a result of this, while 301 acts and joint resolutions were passed by the General Assembly, the governor approved only 15. Several measures were passed over his veto, but the majority became effective without his signature. Among these measures were the following: A liquor act; an act amending the law establishing the insurance department of the State; a measure providing for electrocution as a method for capital punishment; a measure creating a State warehouse commission and providing for operating a State warehouse system for storing cotton and other commodities; a measure providing for a State commission with authority to make and enforce rules and regulations to eradicate or prevent the introduction or dissemination of injurious insects and plant diseases; a measure providing that only citizens may vote at primary elections, although citizens of the United States who have been residents of South Carolina for one year with a bona fide intention of becoming citizens of that State may vote at such election. Provision was made for elections in any city of over 4000 inhabitants upon the question of adopting a commission form of government, and for the adoption of that form of government in cities of over 10,000 and less than 25,000, and cities of over 50,000 and less than 100,000 inhabitants. A similar act was passed relating to cities and towns of not more than 10,000 and not less than 4000 inhabitants. The regulation and supervision of investment companies was provided for.

STATE GOVERNMENT. Governor, Coleman L. Blease; Lieutenant-Governor, C. A. Smith; Secretary of State, R. M. McCown; Attorney-General, J. F. Lyon; Treasurer, S. T. Carter; Comptroller-General, A. W. Jones; Superintendent of Education, J. E. Swearingen; Adjutant-General, W. W. Moore; Commissioner of Agriculture, E. J. Watson; Commissioner of Insurance, F. H. McMaster—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Eugene B. Gary; Justices, C. A. Woods, D. E. Hydrick, R. C. Watts, and Thomas B. Fraser; Clerk, U. R. Brooks—all Democrats.

STATE LEGISLATURE, 1913. Democrats, Senate, 43; House, 124; joint ballot, 167.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

SOUTH DAKOTA. POPULATION. According to the Census Bureau statistics compiled during 1912, out of the total population in 1910, 583,888, the foreign-born whites numbered 100,638, compared with 88,329 in 1900. Of these the largest number came from Germany, 21,543; from Norway, 20,918; from Russia, 13,160; from Sweden, 9998; from Canada, 5894; from Denmark, 5038, and from England, 4024. Other European countries were represented in smaller numbers. The negroes in the State in 1910 numbered 817 and the mulattoes 276. In 1890 the negroes numbered 541 and the mulattoes 231.

AGRICULTURE. The acreage, value and production of the principal crops in 1911 and 1912 are shown in the following table:

		Acreage	Prod. Bu.	Value
Corn	1912	2,495,000	76,347,000	\$28,248,000
	1911	2,310,000	50,820,000	26,935,000
Wheat	1912	3,675,000	52,185,000	36,008,000
	1911	3,700,000	14,800,000	13,468,000
Oats	1912	1,550,000	52,390,000	13,098,000
	1911	1,540,000	11,396,000	4,900,000
Rye	1912	16,000	312,000	162,000
	1911	13,000	130,000	99,000
Potatoes ..	1912	62,000	6,510,000	2,344,000
	1911	56,000	4,032,000	2,822,000
Hay	1912	460,000	2672,000	4,099,000
	1911	459,000	2552,000	2,142,000

a Tons.

MINERAL PRODUCTION. The production of gold in the State in 1911 was \$7,439,874, compared with \$5,402,257 in 1910. The output in 1911 was exceeded by that of only one year, 1908, when gold to the value of \$7,657,376 was produced. The bulk of the output is obtained from the Homestake mines of Lawrence County. The silver production in the State in 1911 was 203,755 fine ounces, as compared with 118,000 fine ounces in 1910. The silver is obtained mainly from refining gold mill bullion.

The total value of the product of gold, silver, and lead in the State in 1911 was \$7,550,758. This yield is only slightly below that of the record output of 1908 and is an increase of \$2,083,727 over the value of the output for 1910. The production of gold was 359,903 fine ounces, valued at \$7,439,874, or almost 99 per cent. of the total value of the mineral production. The increase in gold for the year was 98,569 fine ounces. The yield of silver increased from 118,800 fine ounces to 203,755 in 1911. There were produced 64,311 pounds of lead, compared with 14,136 pounds in 1910. The greater portion of the production of coal comes from the Homestake mine. This mine, which suffered from labor troubles in 1909-10, was again operating at its full capacity in 1911.

MANUFACTURES. The Thirteenth Census, taken in 1910, included statistics of manufactures in the State. These are for the calendar year 1909. The results of the census will be found summarized in the table below:

	Number or Amount 1909	1904
Number of establishments...	1,020	686
Persons engaged in manufactures	5,228	3,562
Proprietors and firm members	942	649
Salaried employees	682	441
Wage earners (average number)	3,602	2,492
Primary horsepower	17,666	11,154
Capital	\$13,018,000	\$7,585,000
Expenses	15,787,000	11,246,000
Services	2,914,000	1,716,000
Salaries	616,000	294,000
Wages	2,298,000	1,422,000
Materials	11,476,000	8,697,000
Miscellaneous	1,397,000	833,000
Value of products	17,870,000	13,085,000
Value added by manufacture (value of products less cost of materials)	6,394,000	4,388,000

As will be seen from this table, the number of manufacturing establishments showed a marked increase in the five-year period, 1904

to 1909. The capitalization in that period nearly doubled. The greatest number of manufacturing establishments, 825, were those connected with printing and publishing. The largest amount invested, however, was in establishments connected with flour-mill and grist-mill products.

FINANCE. The report of the treasurer for the fiscal year ending June 30, 1912, showed a balance on hand July 1, 1911, of \$421,156. The receipts for the fiscal year amounted to \$3,779,652, and the expenditures to \$3,208,519, leaving cash on hand June 30, 1912, amounting to \$992,289. The chief source of revenue is taxation, and the chief expenditures are for education and the support of State institutions.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State, with their populations in 1912, are as follows: State Insane Asylum, Yankton, 950; State Penitentiary at Sioux Falls, 225; State Training School, Plankinton, 75; State School for the Blind, Gary, 25; State School for the Deaf, Sioux Falls, 80; Sanatorium for Tuberculosis, Custer, 17; Northern Hospital for the Feeble-minded, Redfield, 220. The State Board of Charities and Corrections has general supervision over these institutions.

POLITICS AND GOVERNMENT

No legislative session was held in 1912. The session for 1913 convenes January 7, 1913. The most important political event in the State during 1912 was the primary election held on June 10. It resulted in the selection of Roosevelt delegates to the Republican national convention. His vote was 35,637; Taft, 9843; La Follette, 17,821. The Democratic party was likewise divided, Wilson-Bryan delegates getting 4694 votes; Wilson-Clark-Bryan, 4275; Champ Clark, 2722.

In the November election the Republican ticket was elected so far as State officers are concerned. Part of the State officers were regular Republicans and part progressive. The Democrats nominated E. S. Johnson for governor, and although the State was normally 30,000 Republican, Johnson lacked less than 4000 of defeating Frank M. Byrne. For the first time congressmen were elected by district: C. H. Dillon in the first, C. H. Burke in the second, and E. W. Martin in the third, the last two being holdover representatives at large. The vote for presidential electors gave Roosevelt 58,811, Wilson 48,942, Chafin 3910, and Debs 4,662.

The vote for governor was: Byrne, 57,160; Johnson, 53,850; Lovett, Socialist, 3578; Butterfield, Prohibition, 3486. At the November election a new primary law, known as the Richards primary, was adopted. This is far different from anything of its kind heretofore adopted in any State or country, and practically does away with all party organizations. Five other laws and amendments to the constitution were submitted and all were adopted by overwhelming votes. The most important besides the new primary law was a measure requiring locomotives to be equipped with electric headlights.

STATE GOVERNMENT. Governor, Frank M. Byrne; Lieutenant-Governor, E. L. Abell; Secretary of State, Frank Glasner; Treasurer, A. W. Ewart; Superintendent of Instruction, C. G.

Lawrence; State Land Commissioner, F. F. Brinker; Attorney-General, Royal C. Johnson; State Auditor, Henry B. Anderson—all Republicans except Governor Byrne, Progr.

JUDICIARY. Supreme Court: Presiding Judge, Ellison G. Smith; Justices, Dick Haney, Charles S. Whiting, S. C. Polley, and J. H. Gates; Clerk, Frank Crane—all Republicans.

STATE LEGISLATURE, 1913. Republicans, Senate, 35; House, 89; joint ballot, 124. Democrats, Senate, 10; House, 11; joint ballot, 21. Republican majority, Senate, 15; House, 78; joint ballot, 103.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

SOUTH DAKOTA, UNIVERSITY OF. A State institution of higher learning at Vermillion, S. D., founded in 1882. The enrollment in all departments of the university in the autumn of 1912 was 370, divided as follows: Arts and sciences, 212; law, 80; engineering, 40; medicine, 13; music, 25. There are about 50 members of the faculty. There were no notable gifts during the year. An important event in connection with the curriculum was the adoption of type or standard courses based upon a schedule of recitations, worked out with respects to majors and minors, the group system, and other graduation requirements. The library contains about 16,000 volumes. President, Franklin B. Gault, Ph. D.

SOUTHERN COMMERCIAL CONGRESS. See AGRICULTURE.

SOUTHERN NIGERIA. A British colony and protectorate on the Gulf of Guinea. Area, 79,880 square miles; population (1911), 7,836,189. Lagos, the capital and chief port, in the Lagos province, has about 102,190 inhabitants; other towns of the Lagos province are Ibadan (341,875 inhabitants), Abeokuta (264,723), Oyo (217,583), Ijebu Ode (131,326). Towns of the Central province: Warri (64 Europeans, 141,614 natives), Onitsha (399,916), Asaba (200,262), Benin City (84,340), etc. Of the Eastern province: Calabar (57,544), Degema (127,237), Brass (90,171), etc. The country is generally unfit for habitation by Europeans.

	1907	1908	1909	1910
Imports	£4,438,907	£4,284,830	£4,962,544	£5,857,335
Exports	4,202,704	3,409,288	4,169,161	5,304,186a
Revenue	1,469,563	1,387,975	1,361,891	1,933,235
Expend.	1,217,337	1,357,763	1,648,680	1,989,978
Shipping†			1,513,014	807,220

* Trade statistics include goods in transit to and from Northern Nigeria. † Tons entered and cleared. a Palm kernels: £2,450,814; palm oil, £1,742,234; rubber, £311,691; cacao, 101,151; cotton, £78,479; tin ore, £72,660; wood and timber, £60,191; nuts, £43,510; specie, £45,734.

The government contributes £70,000 annually to the administration of Northern Nigeria. The greater part of the Lagos-to-Kano railway is in Northern Nigeria, but the line is controlled by the Southern Nigeria government. A. G. Boyle administered the country in 1912, under the governorship of Sir Walter Egerton.

SOUTHERN PACIFIC RAILWAY. See TRUSTS.

SOUTHERN SOCIOLOGICAL CONGRESS. See PUBLIC CHARITIES.

SOUTH GEORGIA. A dependency of the Falkland Islands (q. v.).

SOUTH ORKNEY ISLANDS. A dependency of the Falkland Islands (q. v.).

SOUTH POLE. See POLAR EXPLORATION.
SOUTH VICTORIA LAND. See POLAR EXPLORATION.

SOUTHWICK, GEORGE N. An American public official and writer, died October 17, 1912. He was born at Albany, N. Y., in 1863 and graduated from Williams College in 1884. He entered the Albany Law School where he remained for one year. He then joined the staff of the Albany *Morning Express* as a reporter. In 1889 he was made managing editor of that paper and then accepted the same position on the Albany *Evening Journal*. In 1895 he received the Republican nomination to the House of Representatives and was elected. He remained in the House from 1895 to 1899, and again from 1901 to 1911. He was chairman of the Republican State convention in 1896. He contributed several articles on political subjects to the *North American Review* and other periodicals.

SPAIN. A constitutional European monarchy, occupying the eastern part of the Iberian Peninsula. Capital, Madrid.

AREA AND POPULATION. The Spanish provinces, with their area in square kilometers and population according to the census of December 31, 1910, are as follows:

Alava	3,045	96,993
Albacete	14,863	264,363
Alicante	5,660	497,616
Almería	8,704	365,016
Avila	7,882	208,817
Badajoz	21,894	564,131

* With Ceuta. † 194,794 square miles.

The greatest density per square kilometer is found in Biscaya—102; in Barcelona it is 148, in Guipúzcoa 120, in Pontavedra 113, in Ma-

drid 109. Huesca and Cuenca show least density, with 16 to the sq. km.; Teruel has 17, Albacete 18, and Cáceres 20. The mean density for the kingdom is 40. Provisional figures for the movement of population in 1911 give 142,119 marriages, 625,172 births, 463,678 deaths (161,494 surplus of births), 175,587 emigrants, 105,055 immigrants. Some of the principal cities, with their communal population, census of 1910, are Madrid, 599,807; Barcelona, 587,284; Valencia, 233,348; Seville, 158,336; Málaga, 136,365; Murcia, 125,243; Saragossa, 113,729; Carthagena, 102,519; Bilbao, 93,536; Granada, 80,511; Lorca, 72,795; Valladolid, 71,066; Palma (Balears), 67,544; Cádiz, 67,306; Santa Cruz de Tenerife, 65,615; Santander, 65,209; Córdoba, 64,407; Las Palmas, 63,947; Jerez, 61,250; Alicante, 55,300.

LACK OF PROGRESS. A report of the minister of the interior occasioned by an order for an investigation into the progress of the country in recent years shows 4500 villages without roads or railroads, 30,000 villages and towns without schools, and nearly two-thirds of the population as unable to read or write. Many private schools are under clerical control, though recent legislations has made attempts to provide for some control of their curricula, condition, and faculties. Public schools are maintained by local taxation. Secondary instruction is provided by one high school in each province, but the curricula are imperfect; special schools are few. There are ten universities.

The struggle of the state against church encroachment still goes on, without notable successes. In December, 1910, a temporary bill was passed seeking to restrain the establishment of additional religious orders until a more comprehensive act could be drafted and passed. Toleration within certain limits is accorded Protestant worship.

PRODUCTION. Of the total area, 79.65 per cent. is returned as "productive" (33.8 per cent as under sown crops and gardens, 3.7 under vineyards, 1.6 under olives, 19.7 under natural pasture, and 20.8 under orchards). As a matter of fact, according to the report of the minister of the interior, although the soil is fertile and conditions favorable to agriculture, 60 per cent. of the land is uncultivated and 38 per cent. is entirely without irrigation. Tropical fruits thrive. The vine is grown in every province, sherry and tent wines coming from Jerez, malaga and alicante from the southeast. In the table below are given areas under main crops and yield for two years, with yield per hectare in 1911:

	Hectares		Quintals		Qs. ha.
	1911	1912	1911	1912	
Wheat	3,927,892	3,851,472	40,414,186	30,594,820	10.3

Sugar cane	7,242	2,732,760

* Yield in table is for seed; yield of fibre, 1911, 15,584 quintals; 1912, 6810. † For sugar. ‡ Yield in hectoliters of must.

Livestock December 31, 1911: 546,035 horses, 904,725 mules and hinnies, 836,741 donkeys,

2,541,112 cattle, 15,725,882 sheep, 3,369,624 goats, 2,472,416 swine, 3398 camels.

In the spring of 1912, 7500 hectograms of silkworm eggs were placed for hatching and the production of cocoons was estimated at 1,175,000 kilograms, as compared with 1,250,000 kms. obtained in 1911. Cotton goods, paper, cork, and glass are manufactured.

Rich mineral deposits exist, but almost the only efficient exploitation is by foreign enterprise employing foreign capital.

In 1909, 3,622,573 metric tons of coal (valued at 47,345,231 pesetas) were raised; 8,786,020 of iron (45,503,256); 2,955,253 of copper (35,407,181); 161,496 of argentiferous lead (30,619,076); 137,049 of lead (18,780,025); 163,521 of zinc (7,388,293); 37,397 of mercury (5,082,425); 265,019 of lignite (3,269,094); 21,749 of sulphur (149,127). Value of fisheries products, between forty and sixty million pesetas; of the output of the sardine factories, about sixteen million pesetas.

COMMERCE. The special trade is given in pesetas below, for three successive years (1 peseta=19.3 cents):

	1909	1910	1911
Imports.....	956,976,672	1,000,036,564	1,065,822,000
Exports.....	925,930,062	970,519,355	965,794,000

Imports for consumption and exports of domestic produce follow, with values in thousands of pesetas, for 1911: Foodstuffs, 170,250 imports, 388,187 exports; cotton and cotton mfrs., 159,440 and 50,118; drugs and chemical products, 149,474 and 38,765; machinery, 134,383 and 4625; minerals and ceramics, 113,037 and 152,306; animals and animal products, 85,080 and 52,949; metals and their mfrs., 60,912 and 139,092; timber, 61,984 and 69,050; silk and its mfrs., 22,469 and 5212; wool and woolsens, 21,803 and 19,226; other textiles, 21,068 and 3449; paper, 16,846 and 12,424; various, 24,475 and 9943; special imports, 21,468; packing, 1886; total merchandise, 1,064,584 imports and 951,348 exports; precious metals, 1238 and 14,446; totals, 1,065,882 and 965,794.

The principal countries of origin and destination follow, values in thousands of pesetas:

SHIPPING. Vessels entered during 1911, 20,766, of 20,900,576 tons (11,358, of 7,948,303 tons, Spanish); cleared, 18,157, of 20,338,480 tons (9069, of 7,475,300 tons, Spanish). Total coasting vessels entered, 57,668, of 15,347,923 tons. Merchant marine January 1, 1912, 582 steamers, of 750,081 tons, and 301 sailing, of 44,325.

COMMUNICATIONS. In 1912 (January 1) there were in operation 14,805 kilometers of railway and 42,553 of telegraph lines (wires, 93,432). Madrid has now a shorter and better connection with Paris by way of the tunnel through

the Pyrenees, which was completed in November, 1912.

FINANCE. The budget for 1912 is detailed below in thousands of pesetas:

Revenue	1000 ps.	Expenditure	1000 ps.
Direct taxes...	474,875	Debt	408,236
Customs	159,100	War	188,367

* Actual revenue and expenditure.

† Agriculture, industry, commerce, and public works.

The public debt stood, January 1, 1912, at 9,407,724,977 pesetas.

ARMY. Compulsory personal military service was established for all Spaniards by the law of June 29, 1911, and the young men declared fit for military service in each annual contingent are divided by law into two groups, the first being incorporated in the active army, usually for three years' service, and the other receiving partial instruction in varying amounts under specified conditions. Service in the reserve amounts to 6 years and territorial service will complete a total period of 18 years. Under the terms of the law of December 26, 1907, an effective strength of 80,000 men was maintained, but this may be increased by the minister of war to 100,000 at certain times, provided a corresponding and compensating reduction is made at others. In 1912 the effective strength was 115,440 men, which number the minister was authorized to increase if necessary. The Spanish war budget for 1913 provided for the abolition of the headquarters staff and of the consultative committees of the various branches of the service and for the transfer and centralization of these powers in the war department, the abolition of the general inspection of the military instructional establishments and industries, the transformation of the captaincy-general of Melilla into a military command, the grouping of the Morocco occupational troops into mixed independent brigades, the increase of the peace effective from 114,000 to 121,000 men, and the formation of a fourth mountain artillery regiment of 2 groups of 2 batteries, and of a telegraph regiment. Accordingly, on December 2, 1912, the minister of war was authorized by the king to present to the Spanish Chamber a proposed law fixing the effective strength of the permanent army at 121,065 men.

NAVY. The navy, exclusive of non-effective vessels, is composed of 1 second-class battleship (9890 tons), 3 first-class protected cruisers (25,133), 1 second-class (5871) and 2 third-class (4083), 4 torpedo-boat destroyers (1845), 1 torpedo boat (127) of the first and 4 (284) of the second class, 8 first-class gunboats (6925) and 8 second- and third-class (3202)—in all, 32 vessels, of 57,360 aggregate tons.

Building are 3 battleships, 4 gunboats, 3 destroyers, and 24 torpedo boats.

GOVERNMENT. The constitution vests the executive power in the king, acting through a responsible cabinet of ministers appointed by himself. The Cortes, conjointly with the king, exercises the legislative authority; there are two houses—a senate (360 members, partly hereditary, partly appointive, and partly elective) and a congress of deputies (431 members, elective). Reigning sovereign (1912), Alfonso XIII. Heir-apparent, Prince Alfonso, born 1907. The assassination of the prime minister, José Canalejas y Mendez (November 12, 1912), leader of the anti-clerical party in the Cortes, in large part author of the Franco-Spanish treaty signed two days after his death, an eminent statesman, and a man feared and hated in many quarters, fulfilled the anarchist prediction persistently reiterated since the execution, in 1909, of Francisco Ferrer. His place was filled November 14 by the appointment of the president of the Chamber of Deputies, Count Alvarado de Romanones, to be prime minister. The rest of the ministry, constituted February 9, 1910, was composed at the end of 1912 as follows: A. Barroso y Castillo, interior; M. García Prieto, foreign affairs; Arias Miranda, worship and justice; Lieut.-Gen. de Luque, war; J. Pidal Rebollo, marine; J. Navarro Reverter, finance; S. Alba, instruction and arts; M. Villanueva, agriculture, industry, commerce, and public works.

HISTORY

THE MINISTRY. In September, 1911, during the general strike, rioters in Cullera brutally murdered a local magistrate and two court officers. Seven men were charged with the murders and six of them were sentenced to death by a military court. At the beginning of 1912 the case was tried before the Supreme Council of War and Marine, which condemned all seven. Public opinion was deeply stirred on behalf of the prisoners, and the premier early in January recommended that clemency should be exercised in the case of six, but that the sentence against the seventh should stand. Later the government was induced to recommend that a reprieve be granted to the seventh as well, the king having expressed his desire that this be done. On January 10 Premier Canalejas tendered the resignation of the cabinet as a matter of form, but resumed office immediately. This act was characterized by certain journals as a "false crisis" and a "political farce." A similar "false crisis" followed a few days later. Upon the opening of the Cortes on January 19 a Republican deputy, Zulueta, attacked the government for its course during the recent strikes, for the execution of the *Numancia* mutineers, for the conduct of the Melilla campaign, and for the "false crisis" just passed. This was followed by attacks by the Radical Albornoz and the Socialist Pablo Iglesias. The premier replied to these varied accusations, which, though violent, seemed in no wise to impair the strength of the ministry, but to the surprise of all he again went to the king to offer the resignation of the cabinet (January 24). There were diverse rumors as to his reasons, but no adequate explanation was given. The king expressed his wish that the present cabinet should continue in office, and again the crisis passed. On March 12 Señor Gasset, finding himself in

disagreement with some of his colleagues, resigned the portfolio of public works and the premier took advantage of the occasion to reconstitute his cabinet, as noted above under *Government*. During this interruption of the session the cabinet worked on the budget, their delay in presenting it having been one of the chief points in the criticism by the opposition, and on the reopening of the Cortes on May 1 the new minister of finance, Señor Reverter, submitted his project in detail. It embodied certain measures of economy which the finance minister had previously outlined to the press, as follows: "After 1907 expenditures increased from year to year to such an extent that our financial resources could not long have borne the burden. It was necessary to go to the root of the difficulty. That is what I have tried to accomplish for the budget of 1913. I have not been willing to appear before parliament without an honest budget—a budget of order and liquidation. It is not a political problem, as people have just now been saying, for all the ministers are in accord as to the plans of economy which I have proposed. It is necessary to tell the country the truth. The present state of the finances does not frighten me. I have seen several times as many millions leave the treasury for colonial wars. We may have to resort to extraordinary loans, but only for the moment." The budget placed the receipts at 1,167,400,000 pesetas, the expenditures at 1,146,900,000 pesetas. It provided for a number of retrenchments, including the suppression of the office of captain-general in Melilla, for a temporary sur-tax on certain imports, for a tax on salt and for a tax on timber. The weak point in it was the low estimate for expenses in Morocco, only 50,000,000 pesetas, which indicated the government's intention to have recourse to the improvident expedient of borrowing. Nevertheless it was well received by the Chamber. A scandal was occasioned by the revelations of Señor Gasset in support of his charges against Señor Barroso, his successor in the ministry of public works. He accused the latter of using his authority when minister of justice to check legal proceedings against one of his relatives for election frauds. Señor Barroso denied the charges, but certain documents read by his accuser created a feeling of suspicion both in regard to Barroso and in relation to the ministry in general. Nevertheless, the position of the ministry seemed secure. Though the anti-monarchist groups were loud in their reproaches, accusing the ministry of a total failure to redeem the pledges they had given on coming into power more than two years before, they were apparently not eager to push their opposition to extremes, for they feared still more the return of Señor Maura and the Conservatives to power. On the close of the debate on the ministerial policy the Chamber voted confidence by 180 against 73 (May 11).

THE OPPOSITION. In September, 1911, the groups opposed to the Canalejas ministry seemed irreconcilable. Republicans and Socialists united in attacking the government, angered by its course in the suppression of the general strike, the suppression of constitutional guarantees, the sending of troops to Melilla, the judgments against Republican newspapers, and the dissolution of trades unions. Moreover, its policy had deeply offended the extreme right. At the beginning of 1912 it seemed destined to a

short tenure of office. But its moderation in the Cullera affair tended to appease the anti-monarchist groups. Both the Socialist and Radical leaders displayed unexpected moderation in their criticism of the ministry. On one point, however, the anti-constitutional groups found themselves heartily in agreement in their opposition to the government. This was the Moroccan War. Radicals and Socialists alike condemned the Moroccan adventure as altogether wicked and wasteful. Despite the government's declaration that it was not embarking on a war of conquest but merely enforcing the application of its treaties, public and secret, and upholding the honor of Spain, the Republicans and Socialists persisted in their denunciations. "Why," exclaimed a member of the opposition, "have we gone into the Riff region? I have never seen a country so poor and destitute. Our troops have to take with them fuel and water. They go unwillingly. Some of them remind me of the convicts they used to send to Ceuta. The same means were employed to prevent their escape. Nobody wants the war. The expedition will add nothing to our prestige. It is only a question of boundaries. So long as Gibraltar stands, our frontier will be the limit of the range of the British batteries." He went on to remind the government that the cost of the expedition had reached the figure of 250,000,000 pesetas. To this the premier replied simply, "I cannot accept the responsibility of abandoning the only territory available for the expansion of Spain." The opposition were not satisfied with this plea or with the previous one, that Spain's honor was involved.

THE WAR IN MOROCCO. In general the Spanish public seemed weary of the long negotiations with France and of the government's campaign in Melilla. As to the latter, Señor Canalejas himself, speaking informally at a dinner, expressed the wish that "this accursed war" would end as soon as possible. Many of the leading newspapers showed their disgust with it. The news from the seat of war was not encouraging. The positions at Samar and Tumiát held by the Spaniards in October and November, 1911, were evacuated, and there was fighting within the zone of military occupation. Mass meetings were held in protest against the war, and at Toledo the Republicans made an especially vigorous demonstration (March 31). In carrying on the war the government was accused of a blind and servile obedience to the caprice of the king. The war was characterized as a wasteful and inglorious adventure, a useless drain on the treasury, and discreditable to the Spanish army. As the campaign dragged on and news of Spanish reverses reached the country, the opposition grew more bitter and the Radicals made common cause with the Republicans in demanding that the war should cease.

THE DECENTRALIZATION BILL. During the summer the chief subject of discussion was the government measure for regional decentralization. It granted, under certain reservations of state control, autonomous government to the departments of the local and provincial administrations. While the Catalans welcomed it, it was attacked both by the Conservatives and by many of the Liberal supporters of the government. The latter pronounced it inconsistent with the policy of their party and an undue concession to the regionalist spirit. It was

passed by the Chamber by a large majority in July and was awaiting ratification by the Senate when the Cortes was adjourned on July 9. During the vacation it was vehemently discussed in the press.

OTHER EVENTS. At the end of September a strike on the railways in Catalonia was ordered, and the men finally decided upon a general strike on all the Spanish railways to be begun on October 8. They demanded increased wages and reduced hours. The revolutionary element rallied to the movement and the affair assumed serious dimensions. The government's policy followed the same line as that of Premier Briand in France during the great railway strike of 1910. It declared that it would resort to all legitimate means to suppress it and the premier issued a mobilization order calling railway servants to the colors. When the men reported for duty they were permitted to go home, but on the understanding that they were soldiers subject to military discipline. They received extra pay. This action, together with the government's promise of laws to redress their grievances led the men to suspend the strike until it could be seen what course the government would take on their behalf. Upon the assembling of the Cortes on October 15 legislation was immediately introduced providing for a settlement of labor disputes. On November 12 Señor Canalejas (q. v.) was killed in the streets of Madrid by an anarchist, and on the following day his body was buried with public honors. He was succeeded, as noted above under *Government*, by Count de Romanones. King Alfonso visited London in August. As to the negotiations and treaty with France concerning Morocco, see *FRANCE*, under *History*.

SPANGLER, HENRY WILSON. An American engineer, died March 16, 1912. He was born in Carlisle, Pa., in 1858 and graduated from the United States Naval Academy in 1878. He acted as engineer of the navy from 1878 to 1889 and again in 1898. From 1881 to 1884 he was assistant professor in mechanical engineering at the University of Pennsylvania and from 1889 until the time of his death was full professor. He was a member of many engineering societies. He was the author of *Valve Gears*, *Notes on Thermodynamics*, *Graphics*, and was coauthor of *Elements of Steam Engineering*.

SPIRITUALISM. See *PSYCHICAL RESEARCH*.

SPIRITUALISTS' ASSOCIATION, NATIONAL. An organization of various spiritualistic societies in the United States into one general association for the purpose or mutual aid and coöperation in benevolent, charitable, educational, and other purposes. The society in 1912 numbered 800, the State associations, 22, edifices for meeting, 200, and the membership of avowed spiritualists, 200,000. The number of public mediums was 2000, and private mediums, many thousands. The ordained ministers numbered 500. The convention of the association was held October 6-13 in Dallas, Tex. Much was accomplished looking toward the extension of edifices for meeting places, especially of a national temple in Washington, D. C. Active effort was being put forth to prevent unjust legislation and local laws against the exercise of mediumship. The president of the association in 1912 was Dr.

George B. Warne; vice-president, Joseph P. Whitwell; secretary, George W. Kates, and treasurer, Cassius L. Stevens. The next annual convention will be held in Chicago in October, 1913.

SPOROTRICHOSIS. A disease caused by a fungus, *Sporotrichium*, which invades the tissues through small skin wounds, or scratches. The sporothrix on finding lodgment produces a hard lump, which breaks down into an abscess or ulcer; making its way through the lymph channels, the infection results in a series of such lesions, which heal very slowly, sometimes taking several months. Like other granulomas, the disease may become systemic, and all the tissues of the body be invaded. Farmers and other workers in rural districts are usually attacked, and the malady is believed to be often mistaken for glanders, tuberculosis, syphilis, blastomycosis, or actinomycosis, which produce similar chronic ulcerative lesions. This confusion in diagnosis probably accounts for the comparative rarity with which cases are reported, only 200 cases being on record throughout the civilized world, 53 of them occurring in the United States since 1898. The diagnosis of sporotrichosis depends on a consideration of the following details: its occurrence in farm workers; a history of slight traumatism succeeded by the slow development of small subcutaneous nodules, following the course of the deep lymphatic channels and softening into cold abscesses and ulcers; and the protracted course of the disease, with little pain and no temperature, or other effect on the general health. Diagnosis is confirmed by finding the sporothrix in the discharges, under the microscope.

SPRAGUE, CHARLES EZRA. An American banker and etymologist, died March 21, 1912. He was born in Nassau, N. Y., in 1842 and graduated from Union College in 1860. He served in the Civil War, becoming brevet-colonel in the New York Volunteers. He was wounded and disabled at the battle of Gettysburg. After the war he became a public accountant and was president of the board of examiners for public accountants in New York City from 1896 to 1898. He was connected with the Union Dime Savings Bank in New York from 1870 and was its president from 1892 until his death. He acted for a time as professor of accountancy in New York University. He was the inventor of many devices and systems for saving banks. He was the author of *Handbook of Volapük* (1888); *The Accountancy of Investment* (1904); *Extended Bond Tables* (1905); and *The Philosophy of Accounts* (1907). He also wrote many articles on language and bookkeeping. He was the first American advocate of Volapük.

SPRING, ALFRED. An American jurist, died October 22, 1912. He was born at Franklinville, N. Y., in 1851. He attended the University of Michigan for two years and in 1875 was admitted to the bar. He was elected surrogate of Cattaraugus County, N. Y., in 1880, serving until 1892. In 1895 he was appointed justice of the supreme court of the State and was elected for the terms 1895 to 1909, and 1910 to 1921. From 1899 to the time of his death he served as a justice of the appellate division. He contributed on legal and other subjects to several magazines.

STAHEL, JULIUS. An American soldier, died December 4, 1912. He was born in Hungary in 1825. He took part in the struggle for Hungarian independence under Louis Kossuth in 1848, and was wounded, and decorated for gallantry. In 1856 he removed to the United States and was engaged in newspaper work in New York City until the outbreak of the Civil War. He was appointed lieutenant-colonel of the Eighth New York Infantry in 1861 and a few months later was made colonel. In the same year he was appointed brigadier-general of volunteers. He reached the rank of major-general of volunteers in 1863. He resigned from the regular army in 1865. In 1893 he was awarded the medal of honor for leading his division after he was severely wounded, and turning the enemy's flank at Piedmont, Va., June 5, 1864. At the first battle of Bull Run he covered the defeat of the Union army. He commanded the defense column of General Fremont's army in the Shenandoah Valley and commanded a brigade of the first division at the second battle of Bull Run. In 1863 he was placed in command of the Eleventh army corps and later in the same year he was sent for by President Lincoln and assigned to a command in front of Washington. In 1884 he was appointed consul at Yokohama, Japan, and consul-general at Shanghai, China. In the following year he resigned this office on account of ill-health.

STANMORE, ARTHUR HAMILTON GORDON, First Baron. A British administrator, died January 30, 1912. He was born in 1829 and was educated at Cambridge University, where he took the degree of M. A.; in 1851. In the following year he became private secretary to the prime minister, his father, Earl of Aberdeen. In this position he served until 1854, when he was elected to Parliament. This seat he held until 1857 when he was defeated. In the following year he accompanied Gladstone as secretary on his mission as lord high commissioner to the Ionian Islands. In 1867 he began a career as colonial administrator, which lasted for thirty years. He was governor of New Brunswick from 1861 until 1866; of Trinidad from 1866 to 1870; of Mauritius from 1871 to 1874; of Fiji from 1875 to 1880; of New Zealand from 1880 to 1882; and of Ceylon from 1883 to 1890. In 1887 he was also made high commissioner for the Western Pacific. In this office he performed efficient service. He was the first governor of Fiji and the first high commissioner of the Western Pacific. In both capacities he laid down principles of administration which have been followed without substantial departure. On his retirement from administrative work he devoted himself to literary, and particularly to public and financial, work in London. He was raised to the peerage in 1893. Among his published works are: *Wilderness Journeys in New Brunswick* (1864); *Story of a Little War* (1879); *Life of Lord*

Aberdeen (1893); *Memoir of Sidney Herbert* (1906); and various pamphlets and articles in magazines.

STATE AID FOR ROADS. See **ROADS AND PAVEMENTS.**

STATE BANKS. The report of the comptroller of the currency showed that there were in the United States, June 14, 1912, a total of 13,381 State banks. Their aggregate resources were \$3,897,770,000, including \$2,549,323,000 of loans and discounts, \$341,797,000 bonds and other securities, and \$241,756,000 cash on hand. Of the loans, 22 per cent. were secured by real estate, and 22 per cent. by other collateral, the remaining 56 per cent. being secured by personal paper. The bonds were composed very largely of State and municipal bonds; but included also a large amount of railroad and other public service corporation bonds.

The total capital stock of these banks was \$459,067,000, to which should be added a surplus of \$177,307,000 and undivided profits of \$94,066,000. Their individual deposits amounted to \$2,919,977,000, of which \$657,477,000 represented savings deposits and \$610,207,000 represented certificates of deposit; practically all of the remainder being deposits subject to check.

STEAD, WILLIAM THOMAS. An English editor and publicist, died at sea April 15, 1912. He was born at Embleton, England, in 1840 and was educated at Silcoates School at Wakefield. At the age of fourteen he was apprenticed to a merchant, but his tastes were for journalism and he became in 1871 editor of *The Northern Echo* at Darlington. He continued in this position until 1880 when he became an assistant on the *Pall Mall Gazette*, of which in 1883 he became editor. He continued in the editorship of this paper until 1889. He was imprisoned for three years for the publication of sensational articles relating to crime against children and women. The agitation started by him resulted in the passing of the Criminal Amendment act of 1885. In 1891 he left the *Pall Mall Gazette* to found the *Review of Reviews*. The *Australian Review of Reviews* was founded in 1894. In 1895 he began the publication of a series called "Masterpiece Library of Penny Poets, Novels, and Prose Classics." He became greatly interested in the movement for world peace and after a visit to the Czar of Russia in 1898, started on a peace crusade. He founded and published a weekly paper called *War Against War*. At the first Hague Conference which he attended he strongly opposed the war with the Transvaal and edited the weekly paper of the Stop the War Committee. In 1890 he proposed the formation of the Union International to combat militarism and to secure the adoption of the recommendations of The Hague Conference. He began in the same year the publication of portfolios of pictorial masterpieces. In 1907 he visited the United

States to be present at the founding of the Carnegie Institute in Pittsburgh, and to further the cause of world peace in America. After this visit he published a book entitled *If Christ Came to Chicago*, which created a profound sensation both in the United States and in England. In addition to his other interests he became a student of, and a convert to, spiritualism. In 1909 he declared that he was receiving daily letters from his son who had died the year before. Among his many publications, in addition to those mentioned above, are: *The Truth About Religion* (1888); *The Pope and the New Era* (1899); *The Labor War in the United States* (1894); *Her Majesty, The Queen* (1897); *Satan's Invisible World* (1897); *The United States of Europe* (1899); *Last Will and Testament of Cecil John Rhodes*; and many articles in magazines and newspapers. Mr. Stead was one of the victims of the disaster to the *Titanic*, on which he was a passenger on his way to the United States.

STEAMBOAT TRUST. See **TRUSTS.**

STEAM ENGINE. No radical innovations in the design of the steam engine were to be found in 1912. Through active studies, increased economy was made and some attention was being paid to flue-gas analysis and combustion recorders so that the fire of the boilers could be improved. This was found to be an important consideration in many plants where fuel economy was greatly increased. The use of superheated steam in some turbines and locomotives suggested its availability for reciprocating engines and during the year progress was made in overcoming the various difficulties involved. In connection with the use of superheated steam it was found necessary to employ separators to obviate the effects of local condensation and to eliminate moisture, as this last element, especially in the case of turbines, caused blade erosion. The most general use of superheated steam was at a temperature of from 100° to 150°. The American uniflow steam engine, which had been developed in 1911, was put on the market during the year and other machines of the same type were developed. This differs from the German Stumpf engine in that it has Corliss instead of poppet valves, but by reducing the loss due to initial condensation secures the same greater economy and has a large overload capacity. This type of steam engine was said to be particularly useful where the load was subject to large variations.

STEAMSHIPS. See **SHIPBUILDING.**

STEAM TURBINE. The success of the 20,000 kilowatt turbo-generators at the Water Side station in New York City and at the Northwest station of the Commonwealth Edison Company of Chicago, led the latter company in 1912 to contract for a still larger unit of this type for its Fisk Street station. This machine, which had a maximum rating of 25,000 kilowatts, was to be the most powerful combined prime mover and generating unit ever built. The generator was to develop 4500 volts and to it was to be connected a step-up transformer raising the potential to 9000 volts. The turbine was of the Parsons type and was being built in Great Britain.

In Europe the Brown-Boveri Company had

constructed a 25,000 h. p. group in the great St. Denis plant at Paris, to supplement the 100,000 h. p. in turbo-generators previously installed, making this the largest turbine station in Europe. The remarkable economy of space of the turbo-generator was shown by the fact that the new group occupied no more floor space than the 10,000 h. p. groups which had been used. The rotary part of this new Paris turbine weighed 40 tons and the outer part 42 tons. A larger turbine of 24,000 h. p. was installed at the Chorzow station in Silesia. It was built by the Allgemeine-Gesellschaft and has a capacity of 24,000 h. p. The Rhinish-Westphalia station at Essen in Germany was supplied with a Zoelly turbine built by the Escher-Wyss Company of Switzerland, which was stated to have a capacity for a momentary load of 30,000 h. p. This turbine, whose rotor and shaft weighed 30 tons, was coupled to a 65-ton Siemens-Schuckert alternator. The growth of the use of the turbine is shown by the fact that of the Zoelly turbine alone, some 500,000 h. p. had been built up to 1912.

Steam turbines in the form of 8000 kilowatt turbo-generators were to be substituted for each of four 3500 kilowatt reciprocating engine sets at the Greenwich station of the tramway system of the London County Council, increasing the station capacity from 34,000 to 52,000 kilowatts, with sufficient economy in the coal expenditure to more than provide the interest on the new capital charges. In Great Britain the Curtis turbine was reported to be finding its way into vessels where previously the Parsons type was regarded as preëminent. This was due, in part, to the use of the helical gear connection between the turbine and the propeller.

STEFANSSON, V. See POLAR EXPLORATION.

STEINERT, MORRIS. An American piano manufacturer and musician, died January 21, 1912. He was born in Scheinfeld, Bavaria, in 1832. He removed to the United States when he was fifteen years of age and became a member of Theodore Thomas's orchestra. He later went to Georgia, but removed to New Haven in 1862. In 1892 he founded the New Haven Symphony Orchestra and was for several years associated with Professor Horatio W. Parker in its leadership. He was a notable collector of musical instruments, and in 1890 took to Vienna his collection of harpsichords and spinets to illustrate a lecture on "The Old Art of Music." He later lectured on the same subject at the World's Fair in Chicago. He owned the largest collection of keyboard instruments and musical manuscripts in the world. The greater part of this was given to Yale University. He founded three scholarships in the Yale School of Music. He was the founder of the M. Steinert Piano Company.

STELLAR AND NEBULAR PARALLAXES. See ASTRONOMY.

STEVENS, HORACE JARED. An American copper specialist, died April 21, 1912. He was born in Coneango, N. Y., in 1866 and was educated in the common schools. He taught school for a time and afterwards served in various capacities in the copper mines in Michigan. En-

tering journalism he became manager and owner of the *Penninsular News Bureau*, and from 1901 to the time of his death was editor and publisher of the *Copper Handbook*, an annual devoted to the copper interests of the world. He was for two years editor of the *Michigan Mineral Statistics*, published by the State, and contributed to annual reviews on the copper in industry.

STEVENS, NETTIE MARIA. An American biologist and educator, died May 4, 1912. She was born in Cavendish, Vt., in 1861 and graduated from Leland Stanford University in 1899. She was appointed reader in experimental morphology at Bryn Mawr College in 1904, serving in that position for one year, when she was appointed associate professor in the same branch. She was research assistant in Carnegie Institution from 1903 until the time of her death. Her chief interest was in the study of regeneration and in the connection of the germ cells with the problems of heredity. She carried on studies in these branches in Naples and in Germany and read many monographs in relation to them. She was one of the most eminent women scientists in the United States.

STEWART, ALEXANDER. An American public official, formerly member of Congress from Wisconsin, died May 24, 1912. He was born in York County, New Brunswick, Canada, in 1829, and was educated in the common schools of that county. In 1849 he removed to Wisconsin and engaged in the lumbering business in which he was very successful. In 1884 he was a delegate to the Republican national convention and was a member of Congress from 1895 to 1901, representing the 9th Wisconsin district.

STOCK EXCHANGE. See FINANCIAL REVIEW.

STOCK-HOLDINGS. See FINANCIAL REVIEW.

STOCK-RAISING AND MEAT PRODUCTION. The year 1912 was an eventful one in the livestock industry, owing to a number of causes, the chief of which was the completion of the liquidation of cattle which had been in progress for several years. Though the number of cattle received at the principal markets was about normal the weight of those arriving was below the average, for the mature beef stock had been cleaned up in 1911. There was no great increase in price until early in the summer, when the shortage became apparent. The rise continued until August, when the price of cattle on the hoof in Chicago exceeded that of the high prices of the spring of 1865, which had previously been the highest ever recorded at that market. This upward movement was accentuated by the promises of a good corn crop, which caused a heavy demand for stockers and feeders, a large number of which were shipped from Chicago in the spring to distant points in the West, there being a shortage of pastures near Chicago because the high price of corn had caused many farmers in the central part of the Corn Belt to plow up their pastures and plant corn.

For many years the movement of livestock, both on the hoof and in the refrigerator cars, has been from west to east, but areas of excessive production and limited consumption are rapidly disappearing and the increase of population in the Mississippi Valley has changed to some extent the method of distribution.

During the year, Virginia sent cattle to Pennsylvania; Tennessee has been sending them to Chicago; and Chicago has sent more stock cattle west than ever before. This is the beginning of a more even production of meat animals throughout the country and in the future it will be produced near points where it is packed or consumed.

About 25,000 acres of land in the Southern States was released from quarantine during the year, making a total of 164,000 sq. m., which have been cleared of the Texas fever tick. The farmers in the South are improving their stock and will soon contribute materially to the meat supply. The value of animals sold and slaughtered on farms was estimated to be worth about \$1,930,000,000, and the total value of animal products for 1912 \$3,395,000,000. The number of cattle on farms in the United States in 1912 was less than 60,000,000, a decrease of 20 per cent. in the last 5 years. The cattle imports during the fiscal year ending June, 1912, were heavier than ever before, while exports dropped to a low ebb. The number imported was 318,372 as against 105,506 exported; whereas in 1902 exports were four times greater than imports, but the value of the exported cattle was much greater per head than those imported, the latter being mainly Mexican stockers, while the cattle exported were finished steers. The value of the cattle imported was \$4,805,574, as compared with \$8,870,975 at which the exports were valued. Had not the Mexican insurrection handicapped traffic across the Rio Grande even more cattle would have been imported. The exports of mutton amounted to only a few hundred thousand dollars in value, but this represents a slight increase. The exports of lard and cured pork hams, which declined in 1910 and 1911, were very nearly restored to figures of earlier years. Exports in eggs have been rising very rapidly and amount to more than three times the average figures between 1900 and 1909. There was an increase in imports of wool and packinghouse products, including hides and skins.

There was an unusually heavy loss of animals in the United States from exposure and diseases. The number estimated for the year ending April 1, 1912, was: cattle, 2,497,581; sheep, 3,834,702; swine, 5,834,456. The highest losses of cattle from exposure occurred in Louisiana, Wyoming, Colorado, Florida, Mississippi, and Montana. The highest loss of cattle from exposure was 80 head per 1000 in the first three mentioned States. The heaviest loss of sheep occurred in Wyoming, Colorado, and Arizona. The heaviest loss among swine was mainly due to hog cholera.

MEAT AND MEAT INSPECTION. The Committee on Markets of the New York State Food Investigation Commission in their study of wholesale cost price and retail selling price found the cash margin to be as follows: Beef hind quarters, 70 per cent.; beef fore quarters, 35.5 per cent.; pork and hams, 45.45 per cent.; lamb, 31.1 per cent.; bacon, 33.33 per cent.; live fowls, 25 per cent.; frozen roasters, 24.15 per cent.; western eggs, 19.47 per cent.; sample White Leghorn eggs, 43.43 per cent.

There has been considerable agitation throughout the country to establish municipal markets similar to those in European cities in order to lower this high cost of distribution. At the

close of the year a number of distributing centres in Philadelphia, Chicago, and Boston for the sale of eggs were opened for the purpose of bringing the consumer and producer of eggs nearer together and temporarily it reduced the price of eggs. Several suits were conducted by the government against the so-called "Beef Trusts" and the corporation known as the National Packing Company was compelled to dissolve and parcel its property out among the different packing interests which held stock in it.

The government meat inspection was conducted at 940 establishments located in 259 cities and towns. There were inspected at the time of slaughter 59,140,019 animals, an increase of over 6,000,000 compared to the preceding year, the greatest increase being in hogs, 5,000,000 more being slaughtered than the previous year. There was a slight decrease in the number of cattle. There was a total of over 600,000 carcasses condemned, wholly or in part. Tuberculosis was the cause of a proportion of the condemnations of cattle and hogs. There were also over 18,000,000 pounds of meat condemned on reinspection after slaughter. Inspection certificates issued for exports of meat and meat-food products covered more than 10,000,000,000, a slight increase over the preceding year. Nearly 27,000 samples of various products were examined in meat inspection laboratories for the purpose of detecting preservatives, coloring matter, adulterants, or impurities. The results showed products singularly free from preservatives and coloring matters. Farmers, retail butchers and dealers, unless they make interstate shipments of meat, are exempt from inspection by law, but it is estimated that federal inspection covers about 60 per cent. of the meat slaughtered in this country. The success of meat inspection since the new law has been in effect has stimulated sentiment for the establishment of abattoirs for the inspection of meats intended for purely local consumption.

SHEEP. The marketing of sheep has been heavy at the principal western markets, so that mutton has been relatively cheap as compared with beef and pork, except for a brief period in the spring. This extra supply of mutton undoubtedly prevented a meat famine, and, in spite of the scarcity of beef and pork, mutton would have been nearly unsalable if packers had not used the surplus for canning and making sausages. But the liquidation in sheep was over at the end of the year.

The trade in wool was heavy throughout the year, and in spite of a record clip in Australia the supply of raw wool is somewhat short of normal. The amount of the clip in the United States amounted to 318,548,000 pounds, having a farm value of \$55,500,000. The flocks in Australia and New Zealand now contain 117,110,654 head, a slight increase over the previous year, but there was a general improvement in the character of the flocks. The cost of wool production was also slightly increased. The over-sea shipments of wool amounted to 662,845,907 pounds from Australia and 169,915,939 pounds from New Zealand. The quality of Australian wool has gradually become less fine and soft than formerly, as the coarser breeds have been found to be more profitable. About 76 per cent. of the Australian clip was sold at colonial centres and the balance on the

London market. A heavy drought causing a loss of 5,000,000 or 6,000,000 sheep and about 25 per cent. of the lambs will reduce materially the Australian clip for the coming year. There was a decline in shipments of wool from Argentina, as sheep are being replaced by cattle. There has been great activity in the sheep industry in Canada, due in part to the measures taken by the government to promote the industry. According to *Dalgety's Review* the total number of sheep in all the principal sheep countries of the world amounts to 616,229,372 head, an increase of about 100,000,000 since 1895.

HORSES. The work of the United States government in breeding Morgan horses in Vermont, carriage horses in Colorado, and gray draft horses in Iowa has been continued, and the average excellence of the foals produced was considerably above that of previous years. A large practical horse-breeding plant has been established at the Tuskegee Institute in Alabama, largely by gift of stallions and standard-bred mares.

POULTRY. The poultry industry, as usual, has continued to increase until now it is valued at \$570,000,000. On October 31, the yearly egg-contest conducted by the Connecticut and Missouri Experiment Stations came to a close. The Connecticut contest was won by a flock of five White Leghorns, which laid a total of 1071 eggs; the highest number of eggs laid by a single hen was 254, by a Rhode Island Red. In the Missouri contest the best hen was a White Plymouth Rock, which laid 281 eggs in 12 months. The leading pen consisted of five rose-comb Rhode Island Reds, that laid an average of 208 eggs per hen. The 655 hens in the contest laid an average of over 134 eggs each. These contests show that both utility qualities and standard-bred points may be combined in the same fowl, as the best laying hen in the Missouri contest during the first eight months was a pure-bred fowl from a pure-bred male and female, both of which had been prize winners at poultry shows. These contests have emphasized the fact that there are both good and poor layers in all breeds of fowls. On April 1, there was finished a decade of annual egg contests at the Hawkesbury Agricultural College in New South Wales. During the decade there was an improvement in the type of breed and the average number of eggs laid per hen per year was raised from 131 to 184.

The eggs exported from the United States in 1912 were valued at \$3,400,800, an enormous increase over recent years. The studies of the Department of Agriculture have been a great help towards improving conditions under which eggs are marketed. During the year a traveling refrigerator was made by the installation of mechanical refrigeration in a refrigerator car. This permits the taking of improved methods into rural districts, where it is otherwise impossible to convince the people what good handling, combined with refrigeration, can do for the producer. Better methods have been devised for handling dressed poultry, marketing fresh eggs, and for the preparation of frozen and dried eggs.

The American Poultry Association, which is the largest livestock association in the world, held its thirty-seventh annual meeting at Nashville, Tenn., the first time it was ever held in the South. The association is doing much to

promote investigation and the development of the poultry industry. The International Association of Poultry Instructors and Investigators was organized in London in July, the object being to interchange knowledge and experience among those engaged in poultry teaching throughout the world. A new method of preserving eggs has been reported from France, which consists of packing them in a specially constructed metal box, in which they are treated with carbonic acid and nitrogen.

The experiment stations have been active in finding economical methods of feeding and finishing all kinds of livestock for market. They have demonstrated that the silo is as advantageous for making beef and mutton as for milk production. The feeding tests conducted during the year at the stations in Alabama, North Carolina, and other southern States have shown conclusively that a combination of silage and cotton-seed meal makes excellent beef at a comparatively low price, which means that in the future the South is going to be a greater factor in beef production than in the past.

LIVESTOCK INDUSTRY IN FOREIGN COUNTRIES. In South America the grain-growing area is being extended, so that the beef industry has not been increasing as rapidly as it otherwise would. The grazing land is increasing in value, so that the jerked beef industry is being supplanted by freezing establishments as jerked beef can be prepared at a profit only when the cattle are grazed at a low cost. Argentina has passed a law providing for a premium to be paid for the first establishment for frozen meat. Uruguay has extended its cattle raising and the annual production is increasing because of improvement in the grade of cattle and the use of silage and improved pastures. The government has made grants to livestock shows and subsidies have been given to breeders' associations. The Brazilian government is establishing stud farms, which will give special attention to the improvement of indigenous breeds of cattle and the improvement of a type of horse suitable for remounts in the army.

Great Britain's supply of beef, formerly obtained from the United States, is now being sent from Argentina. Arrangements have been made for the enlargement of cold storage facilities on the Thames and for the increase in the amount of frozen and chilled meat imported. Livestock returns from England and Wales show a decrease in all species of domestic animals.

The necessity for improving the remounts in the English armies led the government to take steps towards encouraging the industry of light horse breeding.

Besides an unusually large number of experiment station publications, popular articles, and other publications on animal production, the following books have been issued during the year: E. Lavalard, *L'Alimentation du Cheval* (Paris); J. Collier, *The Pastoral Age in Australasia* (London and Melbourne); E. Molier, *L'Equitation et le Cheval* (Paris); Richard Lydekker, *The Horse and its Relatives*; Richard Lydekker, *The Ox and its Kindred*; Richard Lydekker, *The Sheep and its Cousins* (London); F. T. Barton, *Horses and Practical Horse Breeding* (London); P. Dechambre, *Traité de Zootechnie. I, Zootechnie Générale* (Paris); J. T. Critchell, and J. Raymond, *A History of the Frozen*

Meat Trade (London); F. Kleinheinz, *Sheep Management* (Madison, Wis.); H. C. Dawson, *The Hog Book* (Chicago); J. H. Robinson, *Principles and Practice of Poultry Culture* (Boston, New York and London); C. Kronacher, *Grundzüge der Züchtungsbiologie* (Berlin); C. S. Valentine, *The Beginner in Poultry* (New York); D. H. Doane, *Sheep Feeding and Farm Management* (Boston, New York and London); W. A. Dryden and W. T. Ritch, *The Sheep Industry in Canada, Great Britain and the United States* (Canada Dept. Agr., Branch Live Stock Comr., Spec. Rpt., 1911, Nov.); A. Kraemer, *Das Schönste Rind* (Berlin); D. Meyer, *Handbuch der Futtermittel und Getreidetrocknung* (Leipsic); *Hides and Skins* (Chicago); *Origin and History of all Breeds of Poultry* (Chicago); T. Allen, *Profitable Pig Breeding and Feeding* (London); R. S. Matthews, *The Retail Butcher* (Memphis, Tenn.); T. E. Quisenberry, *The Poultryman's Guide* (Mountain Grove, Mo.); J. E. Richelet, *The Meat Industry of Argentina* (An. Soc. Rural Argentine, 46 (1912), No. 2, pp. 160-201, figs. 28); G. Wilsdorf, *Tierzuchtung* (Leipzig); H. Werner, *Die Rinderzucht* (Berlin); C. Correns, *Die Neuen Vererbungsgesetze* (Berlin); H. Kraemer, *Aus Biologie, Tierzucht und Rassengeschichte. Gesammelte Vorträge und Aufsätze* (Stuttgart); J. Rostafinski, *Die Tierzucht Ungarns* (Vienna and Leipzig); C. W. Burkett, *First Principles of Feeding Farm Animals* (New York and London); C. S. Plumb, *Beginnings in Animal Husbandry* (St. Paul, Minn.); H. Draeger, *Die Fleischschafzucht* (Hannover).

STOKER, ABRAHAM (better known as "BRAM"). An English barrister and writer, died April 18, 1912. He was born in Dublin in 1847 and was educated at Trinity College, Dublin. He was admitted to the bar and was for a time inspector of petty sessions in the Civil Service. He later engaged in journalism and worked as literary, dramatic, and art critic for various newspapers. In 1876 he met Henry Irving and two years later became his manager and confidential secretary. He retained this position until the time of Irving's death. Among the many books he wrote are: *Under the Sunset* (1882); *The Shoulder of Shasta* (1895); *Dracula* (1897); *Miss Betty* (1898); *The Jewel of the Seven Stars* (1903); *The Man* (1905); *Snowbound* (1909); and *The Lady of the Shroud* (1909). His best known work, however, is *Personal Reminiscences of Henry Irving* (1906-1907). *b Dracula*

STONE, CHARLES WARREN. An American public official, former Congressman from Pennsylvania, died August 15, 1912. He was born in Groton, Mass., in 1843, and graduated from Williams College in 1863. He studied law and was admitted to the bar in 1866, practicing in Warren, Pa. He also became interested in oil producing and farming. In 1870-71 he was a member of the State House of Representatives and of the State Senate in 1877-78. From 1879 to 1883 he was lieutenant-governor of the State, and from 1887 to 1890 was secretary of State. He was elected to the Fifty-first Congress in 1890 to fill the unexpired term of L. F. Watson, and was reelected to the Fifty-second and Fifty-fifth Congresses, 1891-9. He was a member of several learned societies.

STRAITS SETTLEMENTS. A British crown colony composed as follows: Singapore (206 square miles), Penang (107), and Malacca

(659). Attached to Singapore are Labuan, Christmas Island (Indian Ocean), and the Cocos (or Keeling) Islands; to Penang, Province Wellesley and the Dindings. Total area, between 1630 and 1650 square miles; population (census of 1911), 714,069 (1891, 512,342). The city of Singapore (the capital) had 193,089 inhabitants in 1901. No duties are levied on imports or exports. Tapioca, rice, rubber, and sugar are produced in the colony, and coal is mined in Labuan.

	1908	1909	1910
Imports	316,395,939	313,358,427	364,470,653
Exports	273,818,124	281,183,021	324,189,786
Revenue	8,969,015	8,796,001	9,336,328
Expenditure ...	9,837,624	8,542,731	7,532,242
Shipping	21,760,245	22,192,354	23,429,495

* Trade and financial statistics in Straits Settlements dollars; shipping in tons entered and cleared.

Beginning January 1, 1912, the railways of the Straits Settlements came under the management of the Federated Malay States government. The terms called for a lease of 21 years at an annual rental of \$95,200, subject to septennial revision. It was later proposed to sell the railways to the Federated Malay States government and a joint committee during the year was considering the question of the amount to be paid.

Sir Arthur Henderson Young (appointed 1911), was governor in 1912.

STRAUS, ISIDOR. American merchant and philanthropist, died at sea April 15, 1912. He was born in Rhenish Bavaria in 1845, and removed to the United States with his parents in 1854. He was educated in the Collingsworth Institute, Talbotton, Ga. In 1863 he went abroad as foreign representative of a mercantile house in Columbus, Ga. Returning to the United States he joined his father in 1866 in forming the firm of L. Straus and Sons, importers of pottery and glassware. In 1888, with his brother Nathan, he became a partner in the department store of R. H. Macy and Co., and also in the firm of Abraham and Straus, Brooklyn. Mr. Straus took an active interest in politics in New York City, although he was at no time a candidate for public office. At a special election in 1893 he was appointed to fill the unexpired term of Ashbel P. Fitch in the House of Representatives. Here he became the friend of William L. Wilson and assisted him in the preparation of schedules of the Wilson tariff bill. He was a profound student of economic questions, especially those relating to tariff and trade expansion. He was a warm friend of Grover Cleveland and took a prominent part in the election of the latter for the presidency. Cleveland offered him the portfolio of Postmaster-General, but he declined. He is said to have been largely instrumental in the action of President Cleveland in convening an extraordinary session of Congress for the consideration of tariff measures. When William J. Bryan came into control of the Democratic party, Mr. Straus retired from active participation in public affairs, but in 1908 he served as head of the National Democratic Business Men's League. Mr. Straus was conspicuous for his works of charity and was an ardent supporter of every enterprise to improve the condition of immigrants in New York City.

He was president of the American Educational Alliance and was a member of boards of many philanthropic institutions. He was one of the most successful merchants of the United States and gave much of his wealth to charitable institutions. Mr. Straus was one of the victims of the *Titanic* disaster, and one of the touching incidents of the wreck of that vessel was the refusal of Mrs. Straus to leave her husband when there was an opportunity for her to be saved.

STREET CLEANING. The use of various kinds of pick-up sweepers is increasing, and naturally the newer of these machines are motor-driven, as is increasingly true of street-cleaning apparatus generally. Washing, rather than sweeping, appears to be a growing practice where conditions favor it. A significant study of street-cleaning methods, with a view to determining efficiency standards and cost, was made during 1912 by the Efficiency Division of the Civil Service Commission of Chicago. The study also included garbage and refuse collection and haulage to the point of disposal. See pamphlet *Report on Appropriations and Expenditures Bureau of Streets of Chicago*; also reports of departments of street cleaning for: (1) Boroughs of Manhattan, Bronx, and Brooklyn, and (2) Richmond, for descriptions of methods used and for statistics. The Richmond borough report contains important suggestions for reforms in budget appropriation methods, designed to put the appropriations on a work-quantity and unit-cost basis. The general plan suggested was adopted for this borough for the 1913 budget.

STREET-TRADES. REGULATION OF IN ENGLAND. See CHILD LABOR.

STRIKES. The year 1912 witnessed some of the most extensive and significant labor disturbances of recent years. Probably the most conspicuous of these was the strike of the British coal miners. For the American public the most significant was the strike of the textile workers in the woolen mills at Lawrence, Mass. Dr. W. A. MacDonald, writing in the *Boston Evening Transcript*, estimated the total strike losses for the world during the year ending October 1, at about one billion dollars. He estimated the loss resulting from the British coal strike at \$250,000,000; from the British dock strike, \$15,000,000; from the American anthracite strike, \$50,000,000; from the strike of the employees on the Harriman railway lines \$26,000,000; from the Lawrence textile strike, \$5,000,000. His list included the following strikes: Baggage porters at Cherbourg; revolutionary labor disturbances at Bilbao, Spain; the general strike at Valencia, Spain; the Irish railway strike; the strike of 30,000 laborers at Madrid; the six months' coal strike in western Canada; the 6000 taxicab drivers in London; the 31,000 tailors throughout Prussia; the 300,000 coal miners of Germany; the Havana dock strike; the Belgian riots; the Budapest riots in which 50,000 laborers participated; the strike of the freight handlers of Ontario, Canada; and that of the cigar makers at Manila. The evidence showed that the labor unrest is worldwide. May and June, 1912, were months of excessive disturbance in Great Britain. Thus 69 strikes began in June. In Great Britain 135,900 men and women were thrown out of

work, and the total of 1,505,000 days work was lost.

LAWRENCE MILLS. The most spectacular strike of the year in this country was that of the Lawrence textile workers in January. The first outbreak occurred in the Lawrence Duck mill on January 1, and complete work was not resumed for nearly eleven weeks thereafter. This strike aroused the active interest of the entire country and led to debate and investigation by Congress. It was notable for the appearance for the first time in the Eastern States of industrial unionism or syndicalism (q. v.), the most radical form of the labor movement. It was due primarily to a law effective January 1 reducing the hours of women and children employed in factories from 56 to 54 per week and followed by a corresponding reduction in wages. By January 12 the strike had spread so that it involved some 4000 workers in the cotton mills, and some 29,000 workers in the woolen mills of the city. Not all of these were out at any one time, the proportion of actual strikers varying from 40 per cent. to 70 per cent. The Industrial Workers of the World (see SYNDICALISM) already had small organizations among the English-speaking and the Italian-speaking workers. On January 12, Joseph J. Ettor, a member of the executive board of the I. W. W., arrived in Lawrence, and a strike that would probably have collapsed in a few days because of financial weakness and lack of leadership soon became determined. Ettor, a Syro-Italian of only 26 years, had been a leader in labor disputes at Paterson, Brooklyn, McKee's Rocks, and elsewhere. He succeeded in inspiring the polyglot workers of seventeen nationalities with a sense of the righteousness of their cause and of social solidarity. Troops were sent to the city, by early February there being more than a dozen companies of infantry and two of cavalry on hand.

The strikers presented their formal demands as follows: 15 per cent. increase in wages; abolishment of the premium or bonus systems; double pay for overtime; and no discrimination against strikers. Certain other grievances dealt with speeding up of machinery, fining, and the payment of higher wages to native than to foreign help for the same work. The strikers claimed that they had been induced to come to America and to Lawrence by deceptive posters. The premium system was said to act as a powerful stimulus on account of the low wages and often to lead the workers to sacrifice their health for small increases in pay. Attempts were made to bring about conferences by the State board of arbitration and conciliation; Governor Foss urged the legislature to investigate, and in an open letter urged the strikers to return for thirty days pending an inquiry; and a special committee of the legislature held many hearings. Though the militia had been sent to the scene on January 15 and though there was little violence, a woman, Anna Lopizzo, was shot on January 29. The next day Ettor and his assistant, Giovannitti, were arrested on a charge of being accessories to the murder. A few days previously William D. Haywood arrived on the scene. Early in February the United Textile Workers, a part of the American Federation of Labor, of which a few small unions in Lawrence were members, entered the field. The opposition between craft unionism and indus-

trial unionism was most bitter. Late in February attempts to send children to Philadelphia and New York were resisted by the military and police authorities, thus arousing universal demand for governmental intervention and leading to investigations by Massachusetts officials, by the United States District Attorney, and by the United States House of Representatives. Later several hundred children were sent to these cities and to Barre, Vt.

On March 1 notices were posted in mills announcing wage increases ranging from 5 per cent. to 11 per cent. and averaging 7 or 8 per cent. The largest increases applied to the lowest wages. The strike leaders, however, resisted settlement. It was afterwards charged, and in part shown, that this resistance was due to a desire on the part of the leaders to take advantage of large contributions coming in from socialist organizations of the country. Work was resumed by larger numbers of strikers on March 15 when the strike was practically ended. It was estimated that the strike cost the mill owners and strikers from one to five million dollars and imposed upon the State and city extra police expenses of nearly \$300,000. The sequel to this memorable labor disturbance had several phases. Strikes occurred almost simultaneously at Lowell and Clinton, Mass., Barre, Vt., Passaic, N. J., and various places in Pennsylvania, partly as a result of imitation and partly as a result of the programme of the labor leaders. In all these places wage advances were secured. Moreover, other textile centres, such as Fall River and New Bedford, felt the pressure for higher wages. In New England it was estimated that more than 200,000 textile workers secured wage advances of five to twelve per cent. Total wage increases estimated at \$10,000,000 per year were followed by a slight advance in the price of goods.

Much more significant, however, than the wage advances was the publicity of certain phases of the labor problem which the agitation secured. The low wages and exploitative conditions revealed in an industry conceded to be dependent on the protective system strengthened the belief that the protective system with unrestricted immigration is developing economic inequality in American industrial centres. Some of the mills were highly capitalized and yet ordinarily paid good dividends. The argument that the tariff must be maintained in order to enable the manufacturer to pay high wages was declared to be manifestly false. The fact that the mill owners had at first refused to grant any increase in wages but later granted considerable increases was said to be due to their fear that obstinacy on their part would surely result in congressional reduction of the tariff on textile products. The radical character of the leaders of the I. W. W. was also calculated to arouse public attention. The fact that numerous nationalities were readily brought into coöperation, that evidence of class consciousness among the mill workers all over the eastern States was shown, also forced the public to recognize that the conditions producing the strike at Lawrence were not purely local. The class consciousness of the workers was further accentuated by the long detention of the accused leaders, so that the necessary basis for the spread of radical unionism was greatly broadened.

One of the investigations undertaken was

that ordered by the Senate and made by the Commissioner of Labor. It showed that three-fourths of the 85,892 inhabitants of Lawrence were directly dependent upon the mills. The investigation covered 21,922 operatives. The average wage of all these was found to be 16 cents an hour; 23.3 per cent. of them earned less than 12 cents an hour; and 20.4 per cent. earned 20 cents an hour or over. Almost exactly one-third, or 7275 employees, of whom 5294 were over 18 years of age, earned less than \$7 a week. Of these 5294, 36 per cent. were males. The inquiry showed that the normal family of five must send at least two wage-earners into the mills in order to secure the necessities of life. Where there was no child of at least 14, it thus became necessary for the wife to become a mill worker. These wages brought forcefully to the attention of the public the necessity of minimum wage legislation in order to prevent the undue exploitation of ignorant unskilled workers.

Ettor and Giovannitti, as well as a mill worker, Joseph Caruso, all charged with being accessories to the murder of the Lopizzo woman, were detained in jail, bail being refused. Their trial began about October 1, and continued until late in November. Early in October many thousands of mill workers at Lawrence went on strike for a few days as a protest against this long imprisonment. The case brought out much conflicting testimony as to the cause of death and the attitude of the leaders toward industrial peace. At the very close of the evidence Ettor made a notable speech to the jury. A verdict of not guilty was rendered November 26.

On February 2, John W. Breen, an undertaker and a member of the Lawrence school committee, was arrested on a charge of conspiracy to place dynamite on the premises of strikers, especially in the Syrian quarters. On August 30, William M. Wood, president of the American Woolen Company, and Dennis Collins were indicted on a charge of having instigated the conspiracy. It was alleged that the dynamite had been secured by Ernest W. Pitman, a building contractor, and taken to Lawrence by Collins and Breen, and put by the latter in such places as would discredit the strikers. The evidence sustained this theory, it being shown that special police, previously informed, followed Breen's course, "discovered" the dynamite and arrested a number of Syrians on a charge of having dynamite on their premises.

LITTLE FALLS. A strike in the Phoenix Knitting Mills at Little Falls, N. Y., began early in October. It was due to a reduction of pay following the enforcement of a law reducing the hours of women from 60 to 54 per week. It was thus comparable to the Lawrence, Mass., strike. Socialist and I. W. W. agitators and leaders put themselves in charge. Mayor George R. Lunn, the Socialist mayor of Schenectady, was arrested, with others, for speaking in a strike district, a permit having been refused. The speakers had purposely designed to test their rights of free speech and assembly. Application was made to the governor for protection and the attorney-general rendered an opinion sustaining the rights of free speech and assembly so long as no disorderly acts were committed. On December 17, Mayor Lunn was indicted on a charge of inciting to

riot in an October speech. The New York board of mediation and arbitration began inquiries into the situation on December 27. It was brought out that conditions similar to those at Lawrence existed: a large mass of foreign workers from central, southern, and south-eastern Europe, newly organized by radical labor leaders, were found to be working at grievously low wages. It seemed likely that the efforts of the board would bring the strike to a close at the beginning of the year.

Among other American strikes of the year were the following: In February and March a strike involving 7000 workers in Paterson silk mills for higher pay; in March and April about 3000 strikers in the cotton mills near Utica, N. Y., for higher pay and better conditions, being attended by riots and a call for troops; in March and April a strike of 900 cotton mill workers in West Warren, Mass., resulting in increased pay; about the same time a strike of 800 weavers at Passaic, N. J. In April occurred also a strike of 15,000 carpenters for an increase of five cents per hour at Chicago and near-by cities; in May a strike of newspaper pressmen and stereotypers on the Hearst and other papers at Chicago, followed by sympathetic strikes on Hearst papers in New York, San Francisco, Atlanta, and Los Angeles, resulting in failure primarily because other printers' unions refused to break contracts. In May occurred also a strike of 5000 freight handlers at Chicago, and 2000 laborers at Newark demanding an 8-hour day and a \$2 wage. On May 31 began a strike of about 5000 waiters in restaurants and hotels in New York for better pay and recognition of the union, the strike collapsing on June 25; a similar waiters' strike followed in Boston, being attended by the efforts of Mrs. Rose Pastor Stokes to organize the female employees. In June occurred an extensive strike among the elevated and street railway employees in Boston, accompanied by violence and greatly impeding traffic; about 1000 mill operatives near Middletown, Conn., organized by the I. W. W., engaged in so much rioting that a troop of cavalry was sent to the scene; over 3000 cablemakers quit at Perth Amboy, N. J., demanding higher pay and shorter hours, the strike being attended by rioting resulting in fatalities; a strike of about 5000 foreign laborers near Newark, N. J., was attended by the shooting of several officers and the killing of four strikers and a high school student, 21 of the strikers being afterward sent to the penitentiary. In July a big strike in Atlantic ports, involving 30,000 persons, on a demand for higher wages and better conditions led to rioting and some fatalities. In August, 2500 weavers at Adams, Mass., demanded a closed-shop, and 15,000 street railway employees in Chicago secured wage advances. In September strikes were in progress in coal mining communities in West Virginia and Colorado, in fire arms works at Hartford, Conn., among the trackmen on the Pittsburgh and Lake Erie Railroad, and among the 6000 Greek and Cretan workers in copper, lead, and silver mines at Bingham, Utah; a one-day strike of 1500 street car men at Detroit for better pay; a one-day strike of 12,000 mill operatives at Lawrence in protest against the long imprisonment of Ettore and Giovannitti; and the successful termination of a strike of 9000 miners at Panther Creek Valley, Pa., demanding the

discharge of two non-union men. In October 35,000 employees in copper mining at Ely, Nev., struck for higher pay; striking trainmen on the Georgia railroad agreed to submit their case to arbitration under the Erdman act. In November and December occurred a strike of 1000 yard trainmen in the Homestead, Braddock, and other plants of the United States Steel Corporation at Pittsburgh, for higher wages and the right to circulate petitions, the strike causing much anxiety because of activities of I. W. W. leaders; but it was overcome by the steadfast refusal of the companies to hear complaints of workers collectively. In the Christmas season a strike of express drivers at Newark was attended by violence and great congestion of traffic. On December 30, began a strike of the employees in the men's and children's ready-made clothing industry of New York and vicinity involving at least 100,000 workers who demanded better pay. (See RAILWAYS.)

FOREIGN STRIKES. Among strikes abroad not described above may be noted the following: In January and February strikes of railway and dock workers in the Argentine Republic; of various groups of workers at Brisbane, Australia, in a general sympathetic strike, and of street railway men at Wellington, New Zealand. In April and May a strike of stevedores and harbor engineers at Havana with sympathetic strikes at other Cuban ports. In May great strikes of street railway employees at Lisbon, Portugal; and a general strike in Hungary as a political manifestation following the election of Count Tisza as speaker of the lower house of the Hungarian Parliament; much property was destroyed and several deaths resulted. In June the most important strike was that of the French seamen, beginning at Havre and spreading to other French ports; the strikers demanded increased pay; a number of them were sentenced to fifteen days' imprisonment for desertion; they yielded on August 2, after seriously crippling traffic for six weeks; they gave notice, however, that they were determined to obtain satisfaction and sent delegates to Paris to present their claims. Following the success of the clerical party in June, 100,000 miners, mill workers, glass workers, and railway employees in the Walloon provinces struck as a protest, the strike being attended by much rioting requiring the calling out of reserves; a strike of marine engineers crippled the coastal traffic of Norway; 15,000 miners in the Asturias district of Spain engaged in rioting, the disturbance being largely political in character; a general strike of seamen and transport workers at Palermo, Sicily, of a political character. In October a strike on Spanish railways was met by the government in the same manner as France met the railroad strike in 1910, the army reserves to the number of 60,000 being mobilized. In December a strike of shop employees on the national railways of Mexico resulted in several deaths; on December 31, taxicab drivers of London, estimated at 6000, voted to strike.

GREAT BRITAIN. The year was notable for its large labor disturbances and the radical character of new labor movements. It opened with the strike of 160,000 textile operators in the Manchester district which had begun on December 28, 1911. This strike was due primarily to the refusal of weavers to work with non-unionists; they also demanded an increase in

wages. It was compromised about the middle of January. The most important strike of the year was that of the coal miners for a legal minimum wage, for which see MINIMUM WAGE.

In May began another extensive strike of the dock workers, led by the Amalgamated Society of Watermen, Lightermen, and Watchmen, comparable to the transport workers' strike of 1911 in numbers engaged, but not so extensive in scope or serious in effects. More than 200,000 men were out; there was considerable violence, and great quantities of goods were destroyed. The strike closed abruptly on July 27. The cause was the refusal of unionist workmen to work with a non-unionist. The men and the employers each accused the other party of violating the trade agreement. Sir Edward Clarke was called upon to investigate the case and found that on this point the union was, in the main, correct. At the same time, however, much dissatisfaction was expressed in English labor circles because men had gone on strike before seeking an arbitration of the dispute. The workers were accused of an effort to starve the nation in order to secure slightly better conditions for themselves. Shortly after the strike was begun the transport workers drew up a new and extensive list of demands, including a closed shop in all dock work, and an increase of wages with shorter hours. On the one hand there were papers that accused the government of cowardice in not dealing with the situation with stern repression. On the other, Tom Mann, former president of the International Transport Workers' Federation, declared that it was useless to depend on parliament and government for betterment of conditions since little had been done in a generation. He declared "labor runs the machine and labor will stop the machine until its demands are met." This strike apparently was not well organized. It was precipitated before coöperation of other unions had been worked out and had not been in progress long before funds were lacking for the payment of strike benefits. The men having no individual resources were forced to yield. Nevertheless the growth of labor class sympathy was shown by the fact that before the strike closed steps were being taken to bring into active coöperation the miners, the railway men, and the transport workers. On December 7, 3000 men on the North-Eastern Railway went out on account of a reduction of a main-line locomotive engineer, Knox, to the rank of pilot driver in consequence of his conviction by a local magistrate for drunkenness while off duty. Many of the men struck in spite of a trade agreement. They claimed that only recently the directors had condoned a glaring case of drunkenness of a higher official and that there should be one law for rich and poor alike. Settlement was effected on December 14 on condition that Knox be reinstated, provided investigations by the Home office showed he was not legally convicted, men breaking contracts were to be fined six days' pay.

STRINDBERG, AUGUST. A Swedish novelist, dramatist, and essayist, died May 14, 1912. He was born in Stockholm, January 22, 1849. His father was a small tradesman who had failed in business just before the birth of his son, and his mother was a barmaid in one of the inns of Stockholm. Strindberg's early

youth was spent in poverty. A 18 years of age he left Stockholm to attend the university at Upsala. During his first term he was so poor that he could not only buy no books, but could not purchase wood necessary to heat the garret in which he lived. He soon returned to Stockholm and endeavored to teach in one of the public schools. During this time he began writing. His first attempts were in verse and he soon had written a comedy which, however, has not survived. He then wrote a one-act play which was accepted by the Royal Theatre and was produced with some success. His next play was *The Outlaw*, which brought him the personal good will and financial support of King Charles XV., although it was spurned by critics and the public. Strindberg now returned to the university with the thought of taking a degree. He made no attempt to follow the courses and quarreled with the professors. On the sudden death of the king the small pension which had been granted him ceased and he again returned to Stockholm.

During the next two years he studied medicine and appeared for a short time on the stage as an actor and conducted a trade journal. He also did hack writing for various obscure newspapers. This life he has depicted in his first important novel, *The Red Room*. Finally, at the age of 23, he completed a five-act play called *Master Olof*. This play was greeted with indifference which so disappointed Strindberg that he did not recover from the shock for years. In the meantime he had obtained a position in the Royal Library which gave him a living and free access to all the books. He made researches in philology, including the study of the Chinese language. At this time he wrote a monograph which was accepted by the French Institute. Gradually, however, he renewed his interest in modern affairs. He read and studied modern scientists, philosophers, and novelists. Of the latter, Hugo and Dickens were among his favorites.

At the age of 26 he met a woman who afterwards secured a divorce from her husband and married him. Their married life began happily. He began now to experience his first taste of success. His novel, *The Red Room*, was produced in 1879 and became comparatively popular. He threw himself into the study of Swedish history and the result of this was *The Swedish People*, which is said to be, next to the Bible, the most read work among the Swedes at the present time. He also wrote a series of short stories on historical themes which is named *Swedish Events and Adventures*. About the same time he wrote a volume of satirical essays on social conditions, entitled *The New Kingdom*. During this period he wrote also several plays, including *The Secret of the Guild* and *King Bengt's Lady*. *The Wanderings of Lucky-Per*, a play written for children, also dates from this time. He resigned from the Royal Library and retired to Switzerland for the purpose of devoting all his time to writing. A volume of short stories entitled *Marriage* led to the first turning point in his artistic career. It was a severe criticism on the marriage state. The book was confiscated by the authorities and criminal proceedings were brought against its publisher on the ground that it spoke offensively of sacred rites. Strindberg returned home and became

a defendant in this suit. He was acquitted and became the leader and spokesman of the youth of the country. This experience embittered him and its results are shown in his later writings.

In 1885 he published a volume of short stories entitled *Real Utopias*. This achieved for him a reputation in Germany, where he was at the time living. The second part of *Marriage*, issued in 1886, formed a protest against the modern movements with which women were identified. Perhaps the best known of his plays, a three-act tragedy, *The Father*, was produced in 1887. This was followed by *The Comrades*, a four-act comedy, and by *Miss Juliet*, a realistic drama. Other plays during this period from 1885 to 1894 included eight one-act plays and a fairy play, *The Keys to Heaven*. At the same time he wrote a series of novels and short stories, and five autobiographical novels. Three of these are collectively known as *The Bondswoman's Son*. This treated of his life up to the time of his marriage. In *A Fool's Confession* he laid bare the tragedy of his first marriage, which had been dissolved in 1891.

After the divorce from his wife, Strindberg went to Germany, where his works had been making steady headway. While in Berlin he met a young woman writer of Austrian birth who soon after became his second wife. This marriage lasted only a few years and while it was not as unhappy as the first, it aided in bringing on a mental crisis which resulted in a cessation of his literary labors. He plunged into scientific speculation and experimentation. He began to take great interest in psychic phenomena and was deeply influenced by the writings of Swedenborg. He gradually rejected all the orthodox and established rules of living and became a mystic. This experience finally led to his being placed in a private sanitarium, where he remained until 1896.

In the following year he resumed his writing and soon produced the autobiographical novels, *Inferno* and *Legends*. The former is a remarkable study in abnormal psychology. He next wrote *The Link*, another one-act play. In 1898 he produced the first two parts of a play, *To Damascus*. The last part of this trilogy was not added until 1904.

The next ten years of his life was a period of amazing productivity. Most of his works at this time were of a symbolic nature. They included a play, *The Great Highway*, and a series of plays dealing with historical events in Sweden. These included *Gustavus Vasa*, *Eric XIV.*, *Gustavus Adolphus* and *Charles XII.* In these plays he achieved a higher reputation than he had hitherto attained in Sweden. During the same period he was busy with another group of plays characterized by realistic symbolism. Among these were, *There are Crimes and Crimes*, *Christmas*, *Easter*, and *Midsummer*. Related to this group is *The Dance of Death*, which is considered by many critics as Strindberg's greatest play. He became interested in the project of establishing a theatre in Stockholm and for this project wrote the five dramas which he called "Chamber Plays." In this period of ten years he completed twenty-nine dramatic works in addition to novels, volumes of autobiography, collections of short stories, collections of poems, and three volumes entitled *The Blue Books* which contained his

scientific speculations. Besides this he wrote many pamphlets and satirical studies of contemporary social and literary conditions. From his return to his native country in 1897 Strindberg's life was outwardly quiet. He married for a third time in 1901 and this was dissolved three years later. His last years were spent in Stockholm, where he busied himself chiefly with philological studies.

Strindberg's reputation in the United States is by no means as great as in Europe. This is due largely to lack of knowledge of his works.

STRONG, GEORGE AUGUSTUS. An American Protestant Episcopal clergyman and educator, died March 7, 1912. He was born in Norwich, Conn., in 1832. He graduated from Kenyon College and after working for some years in a bank, entered the Virginia Theological Seminary, where he was a classmate of Phillips Brooks. He was rector in several churches in Pennsylvania. In 1867 he was appointed to the chair of English literature in Kenyon College. Here he remained for eleven years, then becoming rector of Christ Church in New Bedford, Mass. In 1888 he retired from the active ministry.

STUBBS, CHARLES WILLIAM. Church of England bishop of Truro, died May 6, 1912. He was born in Liverpool in 1845, and was educated at the Royal Institution School, Liverpool, and Sidney Sussex College, Cambridge. After holding several minor positions in the church he was appointed in 1894 dean of Ely, on the recommendation of Gladstone. From 1881 to 1895, and again in 1901, he was select preacher at Cambridge, and from 1898 to 1899 at Oxford. In 1906 he was appointed bishop of Truro. He became distinguished as a scholar and militant Broad Churchman, a historical and sociological writer, and a pulpit orator. He wrote many books, among them: *Christ and Democracy* (1883); *The Land and the Laborers* (1890); *Christ and Economics* (1893); *Historical Memorials of Ely Cathedral* (1897); *In a Minister's Garden* (1901). He also edited *Matthew and Mark in the Temple Bible*. He wrote several volumes of verse, including *Castles in the Air*, *Poems Old and New* (1903). He was the author of a book on Cambridge, entitled *Cambridge and Its Story* (1904). *Cornish Bells, Carols, and Verses* was published in 1910. He lectured in 1900 in the United States. Among the subjects which he treated were "Shakespeare as a Religious Teacher," "Milton and the Puritans," "Shelley," "Tennyson," "James Russell Lowell," and "Chivalry."

SUDAN, THE ANGLO-EGYPTIAN. An African country, south of Egypt, under the joint administration of the British and the Egyptian governments. Area, 984,520 square miles; population (1909 census), 2,500,000 (estimated, 1911, at approximately 3,000,000). The capital is Khartum, with (1909) 18,235 inhabitants; Omdurman had 42,779; Khartum North, 35,285. Pupils in all schools (1911), 4118. Total cultivated area (1911), 1,426,497 feddans (116,556 artificially irrigated, 1,192,265 under

rain crops, 117,676 flood irrigation). The shortage of unskilled labor is an undiminished hindrance to cultivation. Vast irrigation schemes are projected; sites have been located and plans drawn up. Imports in 1911 £E2,273,949 (£E1,931,426 in 1910); specie imports £E287,289 (£E126,128); exports, £E1,376,958 (£E977,621); transit and reexports, £E128,610 (£E104,386). The export of dura amounted to 17,794 tons, valued at £E86,657, compared with 32,377 tons (£E118,064) in 1910. The decrease is due to the ruling high prices, as Sudan dura can find a footing in foreign markets only when the price is low enough to enable it to compete on a point of economy. Livestock export in 1911: 21,611 cattle (5646 in 1910), valued at £E129,375 (£E47,491); 97,752 sheep and goats (63,919), valued at £E86,606 (£E62,947). Export of gum, 13,929 tons; cotton (lint and seed), 12,330 tons; millet, 17,147 tons; ivory, 74,961 kilograms. Railways in operation (1911), 1500 miles; telegraph lines, 4965 miles; number of post and telegraph offices, 63. Estimated revenue 1912, £E1,375,600 (1911 actual, £E1,305,000); contribution by the Egyptian government, £E335,000 (£E360,000); estimated expenditure, £E1,538,600 (£E1,351,000); paid to Egyptian government for army in the Sudan, £E172,000 (£E172,000). Sirdar of the Egyptian army and governor-general of the Sudan, in 1912, Lieut.-Gen. Sir Reginald Wingate.

In Kordofan the notorious ex-meg of Tagoi was arrested, tried by a governor's court, and, having been proved guilty of several murders, was hanged April 11, 1912.

SUGAR. The steady progress in the production of beet sugar in the United States is indicated by the yield of nearly 700,000 short tons in 1912, a gain of about 100,000 tons over 1911, which was the record crop up to that time. Thirteen years ago, in 1899, the census showed a production of 81,729 short tons; by 1905 it had increased to 312,921, and in the census year 1909, to 501,682 tons. The present crop is about one-fifth of the national sugar consumption. If the by-products of the beet sugar manufacture are combined with the factory value of the sugar, the total value of the crop of 1912 is about \$67,000,000. There are now in operation in the United States 66 factories in 17 States, which required and used the past season over five million tons of sugar beets from 473,877 acres.

Floods due to the overflow of the Mississippi river severely injured the crop of sugar cane, making the production of sugar from cane the lowest since 1899. The value of the product, including molasses and sirup, was only about \$34,000,000, as compared with \$45,000,000 in 1911. The world's production of cane sugar for 1912-13 is estimated by Willett and Gray (December 26) at 9,028,000 tons, as compared with 9,023,216 tons in 1911-12, and the European beet sugar crop is estimated by F. O. Licht at 8,420,000 tons, as compared with 6,346,000 tons in 1911. This gives a combined estimated production of cane and beet sugar, allowing 625,000 tons for the American beet sugar crop (Willett and Gray), of 18,073,000 tons, an increase of 2,163,000 tons over 1911.

The production in the principal sugar-growing countries was as follows: West Indies and Lesser Antilles 278,000 tons; Cuba, 2,250,000 tons; Hawaii, 500,000 tons; Porto Rico, 320,000 tons; Louisiana and Texas, 170,000 tons; Mexico, 160,000 tons; Central America, 25,000 tons; Brazil, 249,000 tons; Argentina, 145,000 tons; Peru, 140,000 tons; other South American countries, 106,000 tons; British India, 2,400,000 tons; Java, 1,300,000 tons; Philippine Islands (exports), 200,000 tons; Formosa, 112,000 tons; Australia and Fiji Islands, 205,000 tons; Africa, 428,000 tons; Spain, 20,000 tons; and other countries in Europe (beet sugar), 8,420,000 tons.

The Brussels Sugar Convention met during the year to arrange a basis of agreement as to sugar exports. Subsequently the governments of Great Britain and Italy notified the Belgian government that from September 1, 1913, they would cease to be parties to the convention.

LITERATURE. H. C. Prinsen Geerligs, *The World's Cane Sugar Industry, Past and Present* (an English translation of volume 4 of *Handbökten dienste van de Suikerriet-Cultuur en de Rietsuiker-Fabricage*) (England, 1912); C. A. Browne, *A Handbook of Sugar Analysis* (New York and London, 1912); G. E. Nesom, H. S. Walker, et al., *Handbook on the Sugar Industry of the Philippine Islands; The American Beet Sugar Industry in 1910 and 1911* (United States Department of Agriculture, Bureau of Plant Industry, Bul. 260, 1912).

SUGAR TARIFF. See TARIFF.

SULPHUR. Sulphur was produced in the United States in 1911 in Louisiana, Utah, and Wyoming. Nevada, which had hitherto produced on a small scale, reported no production during the year. The admission of Japanese sulphur free of duty undoubtedly affected somewhat the sulphur market in certain of the western States. The production of Louisiana continued to be the chief factor in the domestic industry, and in both Utah and Wyoming the output was greater than during 1910. The total production in 1911 amounted to 265,664 long tons, valued at \$4,787,049 as compared with 255,534 long tons, valued at \$4,005,112 in 1910, an increase in quantity of 10,130 tons and in value of \$181,937. The production of 1911 was the largest since 1908, when 369,444 tons were produced.

There were imported in 1911 29,144 long tons of sulphur. This includes all varieties, crude, refined, flowers of sulphur, and other kinds. The imports were valued at \$552,836. The amount imported was slightly less than for 1910, which was 30,833 long tons. The great bulk of sulphur imported into the United States comes from Japan and it is consumed chiefly on or near the Pacific coast. From Italy were imported 8031 tons, and small quantities were imported from Great Britain and other countries. The exports of sulphur in 1911 amounted to 37,142 long tons, valued at \$736,928, compared with 30,742 long tons, valued at \$552,941 in 1910. The excess of imports over exports amounted in 1911 to only 1041 long tons in quantity. This increase indicated that the United States is providing ample sulphur for domestic demand.

SUMNER, EDWIN VOSE. An American soldier, died August 24, 1912. He was born in Carlisle, Pa., in 1835. He joined the volunteer service in the Civil War as first sergeant of the Henry Clay Guards, Washington. He was later made second lieutenant, and assigned to the First United States Cavalry. He

served as aid on the staff of General Stoneman, chief of the cavalry of the Army of the Potomac and in a short time was made first lieutenant. In 1863 he was promoted to be captain in the regular army and in the following year was appointed colonel of the 1st New York Mounted Rifles. He was brevetted brigadier-general in 1865, and was appointed brigadier-general in the regular army in 1899. As a member of General Stoneman's staff he took part in the closing battles of the Maryland campaign. He also took part in the raid on Richmond and was three times brevetted for gallantry. After the war he served for fourteen years on the Pacific Coast, taking part in many important Indian campaigns. He afterwards served in Kansas, Indian Territory, and Oklahoma. He retired from active service in 1899.

SURGERY. Several methods of reaching the pituitary gland, long considered inaccessible to surgical attack, have recently been devised. This gland is situated at the base of the brain, nearly in the centre of the skull, and exercises an important function with regard to growth and development, by means of its internal secretion. Tumors, cysts, and other disorders of the gland give rise to profound and fatal disturbances of the human organism. Surgeons have reached the pituitary body through the nose, but this route has been unsatisfactory, on account of the bleeding, impossibility of maintaining asepsis, and the permanent damage done to the nasal framework. The method proposed by McArthur is to make an incision through the shaved eyebrow, to trephine the frontal bone just above the middle of the supraorbital arch, and to follow the roof to the orbit back to the region of the pituitary body. Here the covering of dura mater is incised and the necessary surgical work done on the gland. In order to secure room enough for instruments the frontal lobe of the brain is retracted upward and the eyeball displaced downward.

Alexis Carrel's brilliant work at the Rockefeller Institute in the preservation and transplantation of animal tissues, the artificial cultivation of malignant tumors and the anastomosis of blood vessels is already largely familiar to the public, and has been noted in previous numbers of the YEAR BOOK. Some of his later work, dealing with the preservation of animal tissues and their transplantation, is reviewed in the *Journal of the American Medical Association*, August 17, 1912. His experiments had in view two general objects: preservation of tissues in latent life outside the animal organism, and their preservation in active life. A tissue is in latent life when its metabolism becomes so slight that it can hardly be detected, or when its metabolism is completely suspended. Latent life was discovered two centuries ago by Loewenhoeck, who resurrected *Milnesium tardigradum*, which had been com-

pletely dried for a long time, by moistening it with water. In 1840, Doyère also studied the peculiarities of latent life of *Milnesium tardigradum*. He dried some of these animals, heated them to a temperature of 100°C., and, on moistening them, observed that they lived again. These observations were important because *Milnesium tardigradum* is highly organized and contains muscular fibres, nerves, nervous ganglia, etc. Paul Bert, in several famous experiments, preserved in latent life the tissues of mammals, and succeeded in transplanting rats' tails, kept for several days in a small quantity of confined air at a temperature of 12° C. In 1907-08 Carrel transplanted vessels preserved for days or weeks in cold storage in a condition of unmanifested actual life. See CARREL, ALEXIS.

A tissue isolated from the organism can be kept in active life if it is given artificially a normal nutrition. The possibility of the active life of a tissue outside of the organism was demonstrated in 1907 by Harrison, in the anatomic laboratory of Johns Hopkins University. Harrison transplanted the central nervous system of a frog embryo in a drop of fluid taken from the lymph sac of an adult frog. He then observed, during a few days, the growth of the axis cylinders. In 1910, with the collaboration of Dr. Burrows, Carrel observed the growth of tissues of mammals in plasma. In 1912, he found that the permanent active life of the tissues outside of the organism was possible: a piece of a chick's heart pulsed strongly one hundred and four days after its extirpation, and connective tissue was growing actively during the fifth month following its removal from the organism. The success with which tissues can be preserved depends largely upon their character. Highly specialized tissues, such as brain substance and glands, disintegrate so rapidly that a few minutes of blood deprivation suffices for irreparable damage; while skin, bone, and connecting tissue will resist molecular death for long periods if properly conserved: in the case of latent life, in cold storage; in nutrient serums when preservation in active life is desired.

The practical object of all this experimental work is to have on hand vital tissues ready for use in various branches of plastic surgery. For example, Dr. Tuffier, in 1910 and 1911, preserved in petrolatum and in a refrigerator pieces of fat, bone, cartilage, and peritoneum which he had removed from amputated limbs. He also used lipomas and fragments of ovaries and of peritoneum which had to be extirpated during certain operations. These tissues were kept in cold storage for as long as two months. Grafts of lipoma and omentum were inserted by Tuffier between the pleura and the thoracic wall in several cases of pleurisy and intrapulmonary abscesses. In the reconstruction of joints, Dr. Tuffier used pieces of omentum, peritoneum and cartilage. In resection of the elbow he covered the cut surface of the bone with cartilage preserved for five days in cold storage. After seventeen months the patient was examined and the result found excellent. In another case Tuffier covered the ends of the bones with fragments of omentum preserved for one month in cold storage. Ten days afterward the elbow-joint could be moved easily. Ten operations of similar character were successful.

In 1911, Dr. Magitot of Paris, enucleated the eye of a patient suffering with glaucoma. The eye was placed in a tube containing human serum, and kept for eight days in a refrigerator at a temperature of $+4^{\circ}\text{C}$., during which time the cornea remained transparent. Magitot resected the anterior part of the cornea of a man who had been burned by alkali. A large scar had developed on the cornea and the patient was blind. In the opening, a flap of cornea from the eye preserved in cold storage was inserted. The graft lived, and seven months after the operation the transplanted cornea was still transparent and the patient could see through it.

I. S. Haynes, working in collaboration with S. Kopetsky, on the nature and surgical relief of infective meningitis, devised an operation for draining the brain cavities of cerebrospinal fluid, without invading brain tissue, as had previously been done in tapping the ventricles in similar cases. Haynes's operation consists in draining the *cisterna magna*, at the base of the brain. Access to this region is obtained by cutting down upon the occipital bone in the mid-line to the edge of the *foramen magnum* and the first vertebra. A triangular piece of bone, its base including the margin of the *foramen magnum*, is removed by means of a trephine and bone forceps, and the brain coverings opened and retracted. The space immediately underneath is called the *cisterna magna*, which communicates with the ventricles of the brain and the spinal canal. By this means the excess of cerebrospinal fluid, always present in meningitis, is drained off and pressure symptoms relieved. See LISTEN, Joseph, and TETANUS.

SUSSEX MAN. See ANTHROPOLOGY, and GEOLOGY.

SUVORIN, ALEXIS SERGEEVICH. A Russian editor, died August 24, 1912. He was born in 1835, and at an early age was sent to the military school at Veronezh, and in 1853 obtained his commission in the engineers. He left the army and tried unsuccessfully to enter the university. As he had no other means of livelihood he became a schoolmaster in his native village. Here in 1888 he produced his first literary work, the translation of Beranger's *Captive*. This was followed by a series of humorous sketches of country life which appeared in the Moscow magazines. In 1860 he became a tutor in the high school at Veronezh, where he came in touch with local literary circles. Thereafter he was a constant contributor to the Moscow journals and magazines. In 1863 he removed to St. Petersburg. For twelve years he was chief sub-editor of the St. Petersburg *Viedomosti* and became well known as an editor. In 1876 he acquired the right of publishing the *Novoe Vremya*. The first issue of this journal was brought out on February 29 of that year. It was the time of the Serbo-Turkish War, and Suvorin proceeded as correspondent for his own paper to the Balkans, visiting Constantinople, Bucharest, and Servia. Letters written to his journal during this time gave it a predominant standing in Russia. It soon acquired and continued to hold first place among Russian political organizations and became one of the best known papers in the world. It strongly supported the constitutional régime and was national in its home politics.

SWAMP LANDS. See DRAINAGE.

SWAZILAND. A British protectorate (6536 square miles; 1083 white and 98,876 colored inhabitants, census of 1911) in south Africa. Gold was mined in 1910-11 to the value of £57,530 and tin £42,250. Swaziland is included for customs purposes with the Union of South Africa and no trade statistics are now kept. Revenue (1910-11), £68,722; expenditure, £62,257. Debt, £100,000. Mbabane (Embabaan) is the capital. Railway construction was in progress during 1912. Paramount chief, Sobhuza (regent, Nabotsibeni). Resident commissioner in 1912, R. T. Coryndon.

SWEATING. This is a term applied to those industries usually carried on in homes at unduly low piece-rate wages, thus requiring excessively long hours of labor. It is usually associated with insanitary housing, though this is undoubtedly largely dependent on low wages. Various schemes have been tried for its elimination. Organization of the workers has been found impracticable, both on account of their own character and the character of the work. Licensing of the premises and of the workers, with official inspection and supervision, has been tried, but with only moderate success. Consumers' leagues and the use of union labels have likewise had some, though slight effect. The difficulty with this latter scheme lies in the education of the public and the retailers, and in the difficulty of holding them to the scheme in spite of economic disadvantage. The London County Council adopted a set of minimum piece rates for making uniforms for city employees as a means of preventing the use of sweated labor on city contracts. But this law was generally circumvented. Reform has been tried from within through the formation of associations by the clothiers in London. This also failed because those who refused to join undersold those who adhered to higher wage scales. It would seem that where effective organization of workers is impossible sweating can be remedied only by the establishment of a legal minimum wage for the industries involved. See MINIMUM WAGE.

HOME WORK. That phase of the employment of women and children which is most universally condemned is home work. Sweating has been largely abolished in factories through sanitary regulations and inspection, and restrictions of hours through legislation. It still thrives, however, in the tenements and homes of the poor. Its abolition has been resisted primarily on the ground that poverty would thereby be increased, since many of the poorest families are wholly dependent on it for support. The national *Report on the Condition of Women and Child Wage-Earners* showed that poverty in varying degrees is correlated with home work, particularly in the families of the foreign-born. It often happens, however, that the men of such families do not work because their wives, mothers, sisters, or children are able to eke out a bare subsistence by doing home finishing. This report severely condemned home work because of the lack of sanitary conditions, ventilation, and light. The hours of work, were all found to be bad. Moreover, small children, often as young as five years of age, are employed by the home workers in spite of child labor laws. This report pointed out that the driving of home work into the factories would have the effect of raising the wages of

the workers. Thus married shop finishers all earned more than \$2 a week, while of the married home finishers 15 per cent. earned less than that amount; 55 per cent. of the married shop finishers earned \$5 or more, and only 7 per cent. of the married home finishers earned that much. It was found also that many home workers are now dependent, in part, upon outside relief. Home work favors seasonal work. This has the effect of excessive labor during rush periods and complete idleness and a tendency to degeneration during other periods. During the rush periods children are taken out of schools. The federal investigators of the men's ready-made clothing found that 15 per cent. of the children of school age in families doing home work were out of school unlawfully. It is pointed out that, although the abolition of home work would increase the hardships in some families during the period of transition from home to factory, such families could be relieved by charitable organizations and by school scholarships. It is believed by many that home work does not relieve poverty, but rather fosters it and that it is a serious menace to the public health.

NEW YORK. The National Child Labor Committee employed six trained investigators for five weeks on an inquiry into tenement house home work in New York City. See *Annual Report* under CHILD LABOR. They found that home manufacture in city tenements becomes more complicated and difficult of investigation with every increase in congestion. Their inquiry showed that the factories, contract shops, and contractors spring up with marvelous rapidity in nearly every new tenement house section. They found 168 child helpers under legal factory age in 131 families making artificial flowers; of these children 60 per cent. were of ages 3 to 10. Of all children found engaged in home work 36 per cent. were under the legal age of 14. Among families doing home work school attendance is proverbially irregular. They found numerous abuses amounting to heartless exploitation of ignorant workers. The investigators found that only 12 per cent. of families doing home work had widowed, separated, or deserted mothers, and only 3 per cent. had invalid or incapacitated fathers, showing that poverty is not always the cause of home work. Indeed, they were inclined to believe that home work is often due to excessive thrift coupled with ignorance and lack of wholesome standards of life. They found a reduction of the father's responsibility in home work just as noted in the federal *Report* above mentioned. They emphasized the menace to public health due to the very unsanitary conditions of tenement homes, heightened by the complete ignorance of the workers of the relation of dirt and bacteria to disease. They insisted that all home work should be prohibited and the industries driven to the factories.

The New York Factory Investigating Commission was engaged at the close of the year in an inquiry into home work in the metropolis. The number of outside or home workers in the city was estimated at 125,000. Evidence was submitted showing that more than 7 per cent. of tenements where artificial flowers and clothing were made were unlicensed; that many of the places were very unsanitary; and that the work was injurious to the workers and a serious menace to the public health. See CHILD LA-

BOR; MINIMUM WAGE; and WOMEN IN INDUSTRY.

SWEDEN. A constitutional monarchy of northern Europe, occupying the eastern part of the Scandinavian Peninsula. Stockholm is the capital.

AREA AND POPULATION. The area in square miles and the population according to the census of December 31, 1910, are given by prefectures in the table below:

Prefs.	Sq. m.	Pop.	Prefs.	Sq. m.	Pop.
Stockholm*	13	342,323	Skaraborg	3,274	241,260
Stockholm	3,016	229,165	Värmland	7,461	260,140
Uppsala	2,051	128,171	Örebro	3,523	207,038
Söderland	2,630	178,577	Västland	2,602	155,925
Osterland	4,265	294,177	Kop'berg	11,525	233,874
Jönköping	4,449	214,460	Gäfl'borg	7,615	253,775
Kronoberg	3,828	157,968	Väst'mor.	9,856	250,517

Gottland	1,220	55,217	Väst'bot.	22,777	161,372
Blekinge	1,164	149,377	Nörr'ten	40,881	161,093
Krist'stad	2,488	228,321			
Malmöhus	1,865	457,247	Total		
Halland	1,900	147,231	prefs. 169,403	5,522,474	
Göteborg and			Vänern †	2,150
Bohur	1,949	381,279	Vättern †	733
Älfsborg	4,915	287,700	Mälaren †	449
			Hjäl'maren†	185
					Total..172,920 5,522,474

* City. † Lakes.

The total land area is 158,692 square miles. Total number of male inhabitants, 2,699,107; female, 2,823,367. Total population as estimated December 31, 1911, 5,561,799. Number of marriages in 1910, 33,162; births, 138,976; deaths, 80,563; still-births (included in foregoing), 3351; emigrants, 27,816; immigrants, 8142. Population of Stockholm (1911 estimate), 346,599; Göteborg, 170,606; Malmö, 89,719; Norrköping, 46,629; Gäfle, 35,719; Hålsingborg, 33,225.

EDUCATION. Primary instruction is free and compulsory, and the schools are maintained by local taxation with state aid. The system is efficient, the schools are well attended, and illiteracy is uncommon. There are well-developed secondary and special schools, and universities at Lund and Uppsala, besides private faculties. The Lutheran is the national creed, but all others are tolerated. The expulsion, however, of all proselytizing Mormon elders was decided upon, July 20, 1912, by the government.

PRODUCTION. Forest products are a valuable asset. The yield in metric quintals of the principal crops has been as follows in successive years:

	1909	1910	1911	1912
Wheat	1,881,000	2,047,619	2,241,070	2,122,060
Rye	6,338,000	6,237,350	6,270,240	5,861,480
Barley	3,037,000	3,385,320	3,199,720	3,082,150
Oats	11,728,000	12,876,680	11,025,770	12,739,260
Potatoes ..	15,696,000
Beets*	8,211,230	9,901,842

* For sugar.

The livestock report of December 31, 1911, returned 588,485 horses, 2,592,609 cattle, 945,709 sheep, 66,136 goats, 951,164 swine; a decline in comparison with December 31, 1910, of 154,917 cattle, 58,272 sheep, 3043 goats, and 5964 swine; and a gain of 1650 horses.

The mineral wealth is considerable. Output (1910) of iron ore, 5,552,678 tons; 2700 tons of

silver and lead ore, 3638 of copper ore, 49,453 of zinc ore, 5752 of manganese ore, 25,445 of sulphur pyrites, 302,786 of coal. Production of gold (1910), 1,846 kilograms, 30.2 of silver, 355,436 of lead, 3,110,778 of copper, 558,484 of zinc, 603,939 tons of pig-iron, 431,722 tons of bar iron.

In 1909 there were 1200 saw and planing mills employing 35,576 people; value of output 130,795,580 kronor; joinery and furniture factories, 515, employing 10,004 people; output valued at 23,913,784 kronor; wood-pulp mills, 159, employing 11,986 people, value of output 70,841,807 kronor; flour mills, 1403, with 4064 employees, output valued at 111,435,844 kronor.

COMMERCE. The trade, including precious metals, by countries for 1910 and totals for four years, is given in the following table in thousands of kronor (1 krona=26.8 cents):

	Imps.	Exps.		Imps.	Exps.
Germany	231,036	124,483	Argentina	6,624	5,183
U. K.	164,481	190,656	Italy	4,675	2,509
U. S.	52,672	22,582	Africa	3,150	18,347
Russia	47,253	27,745	Spain	2,726	7,563
Denmark	45,086	55,146	Portugal	2,170	1,852
France	28,095	42,352	Other	13,510	27,085
Norway	21,141	28,765			
Netherl'ds	18,379	16,092	Tot.	10,671,633	592,864
Brazil	12,639	1,256	"	'09.616,806	472,980
Belgium	9,145	16,770	"	'08.608,932	482,017
Brit. Ind.	8,251	4,478	"	'07.682,105	524,663

The principal articles of import and export in the 1910 trade are as follows, with values in thousands of kronor:

Imports	1000 kr.	Exports	1000 kr.
Coal	56,133	Timber	169,623
Cereals	54,971	Wood pulp	72,681
Coffee	30,161	Iron	54,765
Hides	30,117	Butter	44,152
Cotton	27,525	Iron ore	43,125
Vegetable oils	23,415	Machinery	34,798
Machinery	20,096	Paper	32,228
Petroleum	18,577	Iron mfrs.	14,304
Oil cake	17,778	Stone	12,961
Iron mfrs.	17,389	Matches	11,854
Copper	15,414	Wooden wares	10,552
Fish	14,910	Hides	10,207
Wool	13,608	Live animals	9,474
Iron	13,604	Fish	8,078

Vessels entered in the 1910 trade, 35,435, of 11,031,000 tons; cleared, 35,407, of 11,064,000. Merchant marine, January 1, 1911, 1635 sailing, of 176,912 tons, and 1214 steamers, of 593,073—total, 2849, of 769,985.

COMMUNICATION. There were, at the end of 1911, 13,972 kilometers of railway open to traffic, of which 4460 were operated by the state and 9512 by private companies. State telegraph lines, 10,273 kilometers; railway telegraph lines, 10,468.

FINANCE. The budget for 1913 balanced at 263,027,200 kronor, the main sources of revenue being customs and excise, 110,000,000 kr.; tax on income, invested capital, etc., 51,700,000; revenue-earning administrations, 36,029,700; from loans, 44,805,300; state bank profits, 6,311,000; etc. Main branches of expenditure: Army, 48,850,280 kr. ordinary, 6,274,820 extraordinary; navy, 20,223,450 and 5,822,965; worship and instruction, 26,250,550 and 4,514,050; finance 14,682,949 and 3,129,151; interior, 12,074,046 and 7,083,254; administration of

State enterprises, 33,142,300 and 6,969,600; etc. The total debt stood January 1, 1912, at 606,096,173 kr., contracted in large part on account of railway construction.

ARMY. Progress was made during 1912 in the scheme of reorganization which was to be completed by 1914. Personal service is required, but the time spent with the colors is short, consisting of 8 months for the infantry and 1 year for the cavalry and artillery. The obligation, however, is for 8 years in the first line of the Beväring, 4 in the second line, and 8 in Landstorm. The organization of the army consisted of 28 regiments of infantry of various strengths, aggregating 81½ battalions; 8 regiments of cavalry, amounting to 50 squadrons; 60 batteries of artillery, including 3 horse batteries; 4 heavy batteries; 7 fortress batteries, and technical troops. In 1912 the reorganization of the artillery took place and 20 additional batteries of light field howitzers were provided. During the year an additional battery was added to the heavy artillery and also a battery of machine-guns. The fortress artillery was comprised of 2 regiments. The peace strength of the army was estimated at about 28,000 men, of whom 22,000 were actually serving, while those joining for short repeating exercises and duly enrolled would bring the total up to about 64,000, including the Landstorm. An approximate war strength of about 450,000 would be available, which with the plan of the new scheme, would be raised to 600,000 men. On September 10, 1912, a surprise mobilization occurred.

NAVY. The effective fleet (1912) contained 93 vessels of 68,100 aggregate tons, as follows: 12 coast defense vessels (42,600 tons), 1 armored cruiser (4100), 10 protected monitors (7200), 5 torpedo gunboats (4000), 4 gunboats (1850), 8 destroyers (3450), 31 first-class torpedo boats (3100), and 22 second-class (1300), besides submarines, school-ships, dispatch boats, etc. Building are 1 coast-defence vessel, 5 torpedo boats, and several submarines, the exact number not being officially disclosed.

GOVERNMENT. The king is the executive, acting through an executive council. The legislative body is the Riksdag, composed of an upper chamber (150 members elected for six years) and a lower chamber (230 members elected for three years). Reigning sovereign (1912), Gustaf V. (born 1858). Heir-apparent, Prince Gustaf Adolf (born 1882). The ministry, constituted October 7, 1911, was composed in 1912 as follows: Karl A. Staaff, minister of state; Dr. J. J. A. (Count) Ehrensvärd, foreign affairs; Gustaf Sandström, justice; Dr. David K. Bergström, war; Jacob L. Larsson, marine; P. Axel V. Schotte, interior; A. T. (Baron) Adelsvärd, finance; Dr. F. Berg, warship; P. Alfred Petersson, agriculture; B. A. Petré, Karl J. Stenström, without portfolio.

HISTORY

GENERAL POLITICAL SITUATION. Before the last general elections to the Riksdag in 1911 the Left controlled the majority in the lower house and the Right in the upper house. In 1900 the new electoral law established universal suffrage for elections to the lower house, but the property qualification was retained, though lowered, for the election of senators. For a long time past the Conservative Lindman min-

istry had remained in power despite the adverse majority in the lower chamber. Against this state of affairs the Liberals who desired to advance to a purely parliamentary system, protested, and in the last electoral campaign, M. Staaff, the chief of the Liberal party, insisted that constitutional reform was the main point in the Liberal programme. M. Lindman and the Conservatives, on the other hand, stood by the constitution and opposed any further extension of parliamentarism. In a sense the Swedish ministry conformed to the principles of parliamentary government, despite the complaint of the Liberals that it governed against the wishes of a majority of the popular representatives; for on two important classes of questions, namely those of subsidies and taxes, the joint vote of both houses is required, and the majority in the total vote was Conservative owing to the great preponderance of Conservatives in the upper house. Hence the ministry could say that after all it rested on a majority in Parliament. Moreover, for some years past it had become the custom for the king to appoint the ministry chosen by the majority in Parliament. Thus there was in Sweden virtually a responsible ministry, though not necessarily depending on a majority in the lower house. The elections for that body in 1911 gave the Left a still larger majority, 102 Liberals, and 64 Socialists against 64 Moderates or Conservatives, and a Liberal ministry under M. Staaff assumed the government. On accepting office M. Staaff received the king's assurance that the upper chamber would be dissolved and new elections held before the next meeting of the Riksdag on January 15, 1912. The Liberals hoped to gain enough seats in that body to control a majority in joint session. If they did not, they talked of constitutional reform, which would remove the power of the upper house to oppose the wishes of a majority of the popular representatives. The recent course of the British Parliament in abolishing the veto power of the House of Lords was frequently cited with approval by Liberals, who have long regarded the British parliamentary system with admiration. But the present need of such a radical programme was removed by the successful outcome of the elections which gave them a strong enough minority in the upper house to place them in the majority when both houses voted together.

PARLIAMENT. On the opening of the Riksdag on January 16, the king in the course of his address announced that the time had come when justice required that the suffrage should be extended to women and that therefore a bill would be laid before Parliament during the coming session giving the parliamentary vote to women under the same conditions as to men. Referring to the recent measures of electoral reform removing distinctions based on wealth and to the great extension of the suffrage, the king reminded his hearers that they were now more truly representative of the people than ever before. The suffrage bill was presented on April 2. It gave women the right to vote and to hold office on the same terms as men, but denied the suffrage to married women whose husbands had paid no taxes for three years.

An important debate occurred in the Riksdag toward the end of May, when the Social Democrats introduced their bill for neutralization. The bill was referred to a special committee,

which decided against it. In the course of the debate, the foreign minister, Count Ehrensvärd, declared that while Sweden was firm in her allegiance to her traditional policy of neutrality and intended to be so in future, she would not refuse to defend by all the means in her power any violation of her neutrality. The bill was rejected without being put to a vote.

The popularity of the Conservative scheme of naval defense was illustrated in May by the offer by a deputation to the king of a popular subscription of 12,000,000 kronor to build a battleship for the navy. The king in accepting the gift applauded the patriotism and generosity of the people.

SWEET, HENRY. An English philologist and educator, died April 30, 1912. He was born in London in 1835, and was educated at King's College, London, Heidelberg University, and Balliol College, Oxford. From boyhood he was interested in the study of alphabets, and he early adopted philology as his life work. In two branches, phonetics, and later, Old English philology, he early obtained a position in the first rank of European scholars. The teaching of English pronunciation in Germany is based almost entirely on his work. In addition to studies in these branches he made researches into Arabic and Chinese, and on the science of language in all its aspects he was a profound and original thinker. From 1901 until the time of his death he was University Reader in Phonetics at Oxford University. He wrote many works on philology. These include, *A History of English Sounds*, *Primer of Phonetics*, *A History of Language*, and *The Practical Study of Languages*. He also edited many editions of Old and Middle English texts, and contributed many papers on philological subjects to reviews and journals of learned societies.

SWETT, SOPHIE MIRIAM. An American author, died November 12, 1912. She was born in Brewer, Me., and was educated in the private and public schools of Boston. She was at one time associate editor of *Wide Awake* and was the author of many short stories and juvenile books. The first of these was *Captain Polly*, published in 1899. Among others were, *Stories of Maine* (1899); *The Young Ship-builder* (1902); *Princess Wisla* (1908), and *The Six Little Pennypackers* (1911).

SWIMMING. Many new records were established in 1912, the fact that some of the figures set by Charles M. Daniels of the New York A. C. were bettered being especially notable. It was the opinion of the experts that Daniels's marks would stand for a much longer period than they did. Duke Kahanamoku of Honolulu, Kenneth Huszagh of Chicago, Perry McGillivray of Chicago, and L. B. Goodwin of New York all had a hand in the record-breaking performances of the year. Kahanamoku created a world's record for the 100 meters over a straightaway course at the Olympic games, covering the distance in 1 minute 2¾ seconds and lowered Daniels's time for the 220 yards, open water, from 2 minutes, 40¾ seconds to 2 minutes, 40 seconds. McGillivray smashed another Daniels's mark by swimming 440 yards in a 60-foot pool in 5 minutes, 23¾ seconds. Goodwin's chief feat of the year was to swim a mile in tidal water in 25 minutes, 36¼ seconds, lowering the record made by James H. Reilly in 1911 by 4¾ seconds. The show-

ing made by the Americans entered in the Olympic swimming events was very creditable considering the few who were able to make the Stockholm trip. See OLYMPIC GAMES.

The championships of the Amateur Athletic Union were held in several different cities at various times during the year. The winners of the principal events were: Indoor—50 yards, Philip Mallen, Chicago A. A.; 100 yards, D. Kah-anamoku; 220 yards, P. McGillivray, Illinois A. C.; 500 yards, J. H. Reilly, New York A. C.; 440-yard relay, City A. C. (R. E. Frizell, J. C. Eddy, Jr., H. R. Adae, and R. M. Ritter); springboard diving, G. W. Gaidzik, Chicago A. A. Outdoor—440 yards, R. E. Frizell, City A. C.; 880 yards, L. B. Goodwin, New York A. C. (1911 winner); 1 mile, L. B. Goodwin; high diving, J. F. Dunn, New York A. C.

Pennsylvania won the intercollegiate indoor team championship with a total of 30 points. Yale was second, with 23 points. Shryock of Pennsylvania won the 50-yard event and Palmer of Yale the 220 yards. Sharp of Pennsylvania in the 100-yard race established a new record of 58½ seconds. Yale won the 200-yard relay in the record time of 1 minute, 48¾ seconds. Willis of Pennsylvania captured the plunge for distance, with 74 feet, 6 inches. Later in the year the same swimmer went 80 feet, thereby breaking the record of 75 feet, 11 inches held by M. Kaiser. The Conference College Championships in the West were won by Illinois. Northwestern finished second. The Annual Mississippi Marathon (10 miles) was won by C. Heath, who covered the distance in 1 hour, 39 minutes, 2½ seconds. J. H. Taylor won the English long-distance championship (5 miles, 60 yards) in 1 hour, 5 minutes, 7½ seconds.

SWITZERLAND. A federal republic of central Europe. Capital, Bern.

AREA AND POPULATION. The area and *de facto* population (census of December 31, 1910) by cantons are given in the following table:

	Sq. kms.	Pop.	Sq. kms.	Pop.
Zürich	1,724.76	503,915	Appenzell	
Bern	6,844.50	645,877	A.-Rh.	242.49
Lucerne	1,500.80	167,223	Appenzell	
Uri	1,076.00	22,113	I.-Rh.	172.88
Schwyz	908.28	58,428	St. Gall	2,019.00
Obwalden	474.80	17,161	Graubün-	
Nidwalden	290.50	13,788	den	7,132.80
Glarus	691.20	33,316	Aargau	1,404.10
Zug	239.20	28,156	Thurgau	1,011.60
Fribourg	1,674.60	139,654	Tessin	2,800.90
Solothurn	791.51	117,040	Vaud	3,252.00
Basel-Stadt	35.76	135,918	Valais	5,224.49
Basel-L'dt.	427.47	76,488	N'chatel	807.80
Schaff-			Geneva	282.35
hausen	294.22	46,097		
			Total	41,323.99
				3,753,293

Total *de jure* population, 3,765,123. Protestants numbered 2,108,642, Roman Catholics 1,590,832. Speaking German as their native tongue were 2,599,194; French, 796,220; Italian, 301,323; Romansh, 39,912; other languages, 28,172. Marriages in 1911 27,809; births, 94,082; deaths, 62,168; still-births (included in foregoing), 2855. In the same year 5512 Swiss citizens emigrated—4196 to North America, 1145 to South America, 15 to Central America, 80 to Australia, 40 to Asia, and 36 to Africa. Bern (communal population estimated 1912) 89,900 inhabitants; Zürich, 192,200; Basel, 135,500; Geneva, 132,800; Lausanne, 69,100; St. Gall, 62,400; Lucerne, 40,900; Chaux-de-Fonds, 38,

600; Winterthur, 25,700; Bienne, 23,900; Neu-châtel, 23,600.

EDUCATION. There is no federal direct control of education, authority being vested in the cantons and communes. Primary instruction is free and in the Protestant cantons attendance is enforced. Secondary schools are amply provided and well attended. There are excellent special schools and seven universities.

PRODUCTION. In the valleys agriculture is carried on. About one-sixth of the area of the country is forest. The area under main crops and yield for two years, with yield per hectare in 1911, are shown below:

	Hectares		Quintals		Qs.
	1911	1912	1911	1912	ha.
Wheat....	42,365	42,200	959,200	865,000	22.6
Rye.....	24,254	24,500	464,321	433,000	19.1
Barley....	5,182	5,000	98,800	93,000	19.1
Oats.....	32,644	33,000	704,000	583,000	21.6
Corn.....	1,330	1,330	30,800	27,000	23.2
Vines.....	23,700	23,700	854,770	903,000	36.1
Tobacco..	290	320	5,590	5,500	19.3

* Yield in hectoliters of wine.

The quantity of silkworm eggs placed for hatching in the spring of 1912 was 188 hectograms; production of cocoons, 31,200 kilograms, compared with 42,835 kilograms in 1911. Live-stock 1911: 144,000 horses, 1,443,000 cattle, 160,000 sheep, 340,000 goats, 569,000 swine. The dairy industry comprehends several distinct branches—the manufacture of butter, cheese, condensed milk, and milk chocolate. The timber industry and pisciculture are important, as are also salt mining, and the manufacture of cement and alcoholic liquors. Outside of the big business plants, house industries employ large numbers of both men and women; watches and clocks, gloves, and other leather goods, pottery, tobacco, and snuff, etc., are thus produced. The silk and cotton industries employ in the neighborhood of sixty thousand persons.

COMMERCE. The imports and exports of merchandise by countries of origin and destination in the 1911 trade are set forth in the table below, in thousands of francs:

	Imps.	Exps.	Imps.	Exps.
Germany	581,395	274,879	Arg'tina	29,232
France	339,633	132,627	Brazil	18,550
Italy	180,629	85,234	Colombia	11,055
Aus.-Hun.	113,884	85,045	Oth.S.A.	16,388
U. K.	99,857	212,920	Asia	48,144
Neth.	23,993	9,871	Africa	32,732
Belgium	38,926	25,226	Australia	13,188
Spain	24,772	22,800	Unstated
Rumania	32,346	9,056	Other	250,237
Russia	89,580	48,064		
Oth.Europe	27,177	32,305	Tot.'11	1,802,359
U. S.	75,085	142,228	" '10	1,745,021
Canada	11,863	24,486	" '09	1,602,140
				1,097,666

Imports and exports of coin and bullion in 1911, 41,484,268 and 31,528,813 francs respectively; in 1910, 42,890,821 and 28,258,200—making total trade, in 1911, 1,843,843,263 francs imports and 1,288,838,217 francs exports; in 1910, 1,787,911,832 and 1,224,130,331. The principal articles of the 1911 trade are given in the table on page 696.

COMMUNICATIONS. There were January 1, 1912, 5112 kilometers of railway in operation. Most of the railways have been nationalized, but the state lines do not show a uniform working profit nor, in some cases, any profit at all.

Imports	1000 fr.	Exports	1000 fr.
Cereals, etc.....	199,400	Cottons	242,400
Silk	148,500	Watches	164,000

Leather	24,800	Animals	12,600

During the year the question of the electrification of the state railways assumed considerable importance, as the annual fuel bill approximated \$5,000,000 and the coal must be imported from abroad. Several commissions investigated the matter of general electrification, using water power under government control, and it was proposed that this should be done in stages, beginning with the sections which were most easily convertible. Accordingly a state generating station was to be erected at Amsteig in the Uri canton and electrification was to be begun on the St. Gothard line with its steep grades and many tunnels. The total expense involved in electrifying the whole Swiss federal system was estimated at \$100,000,000. It was proposed to use single phase alternating current with a pressure of 15,000 volts on the overhead wires. Electric railway construction in Switzerland, which had been particularly active during 1912 and the years immediately preceding, has resulted in the completion of the following lines in the canton of Tessin: Locarno-Bignasco, 17 miles; Bellinzona-Mesocco, 16 miles; Biasca-Acquarossa, 9 miles; Capolago-Chiasso, 8 miles; Lugano-Ponte Tresa, 8 miles; Lugano-Tesserete, 5 miles; Lugano-Cardo-Dino, 5 miles.

Several important though short lines of railway were completed in Switzerland during the year 1912, among which the following are worthy of mention: Bernina Pass line, 37 miles, connecting the Engadine with the Italian railway system at Terano; the Davos branch of the Rheatische road, which also traverses the Engadine valley; and the Sweisimmen-Leuk branch of the Montreux-Oberland railway, which passes through one of the most beautiful sections of the Bernese Oberland range. The latter is a link in the chain of mountain roads financed by the canton of Bern at a cost of \$26,000,000. Progress continued on the extension of the Jungfrau line, and the tunnel to Jungfraujoch was pierced in February (see TUNNELS); but the complete line to the summit was not expected to be finished for several years. Progress was made also with the Lotschberg tunnel, which is over nine miles long and establishes a new and important traffic outlet for Switzerland. It shortens the distance between London and Milan and other points in northern Italy by several hours, and when completed and equipped with electric motive power, according to the plans, will prove an important branch of the transportation system of Switzerland.

The Swiss railways give employment to 42,000 people, 35,200 of whom work on the state lines

and 6800 on private railways. These figures are exclusive of the tramways or funiculars, which for the most part are common to the municipalities or the cantons. Receipts of the state railways for 1911 were as follows: Passenger traffic, \$15,001,890; freight traffic, \$21,263,988; other receipts, \$1,458,926; a total of \$37,724,804. Expenditures were \$22,664,762, making a balance in favor of the government of \$15,060,042.

State telegraph lines (1911), 3575 kilometers; wires, 26,306.

FINANCE. The details of (actual) revenue and expenditure in 1911 are seen in the following table:

Revenue	1000 fr.	Expenditure	1000 fr.
Customs, etc.....	80,948	Military	44,778
Investments	4,469	Interior	16,867

The debt stood, January 1, 1912, at 255,130,031 francs.

ARMY. The federal forces are organized as a national militia rather than as a standing army, and liability to service involves thirteen years in the auszug or elite, twelve years in the landwehr, and six in the landsturm, but previously the young men and boys have undergone gymnastic and military training in schools and cadet corps, so that they are prepared for military service and can avail themselves of the recruit course in the first year of service, which amounts to 92 days for the cavalry, 77 days for the artillery, and 67 days for the infantry, with repetition courses of 13 days every year, so that there is an aggregate service during the time spent in the auszug of 141 days in the infantry, 146 in the engineers, 160 in the cavalry, and 163 in the artillery. In 1912 special orders were issued for the landsturm, defining their service as principally for frontier and communications guard. Under the provisions of the law of 1907, the organization of the army came into effect April 1, 1912, whereby staffs were provided for the eventual formation of three army corps with the requisite divisions, brigades, and other subdivisions. There were thus composed six divisions and mountain and fortress troops. Each division was given a sapper battalion and a company of telegraphists bearing the same numeral as the division. The sapper battalions consisted of four companies and in each of them the fourth company was organized as mountain troops. In addition three pontoon battalions were organized with six bridging equipments, a photoelectric company attached to the foot artillery, two army telegraph companies, two balloon companies, and a company of signalers. The auszug was made up of thirty-six infantry regiments, eight companies of cyclists, six companies of infantry for communications, six groups of guides, four brigades of cavalry, six brigades of artillery, with technical and other troops. The auszug and landwehr embraced three corps of foot artillery, three battalions of

bridge builders, aviation corps, and other troops. The landwehr was divided into six infantry brigades, of seventy-two battalions, six battalions for communications, twelve squadrons of guides, cyclists, machine-gun companies, engineers, and other technical troops. The field army was estimated at over 200,000, of which 140,000 were in the auszug and the remainder in the landwehr, while the landsturm consists of about 300,000 men. The application of the law of 1907 brought about a substantial increase in the army budget for 1912, while the army factory at Bern and other military works were also responsible for increases in the national expenses.

GOVERNMENT. The constitution of May 29, 1874, entrusts the executive authority to a federal council (seven members) presided over by a president and a vice-president elected annually. The council is elected for three years by a federal assembly composed of a national council (167 members, directly elected for three years by popular vote) and a council of states (44 members, directly elected in some of the cantons and in others by the legislative authorities). Ecclesiastics alone are ineligible for office among Swiss citizens over twenty years of age.

The principles of the referendum and recall are in force. To the federal government alone is given power to make treaties and to declare war, and in its control are the army and the postal, financial, and customs departments. The treaty of Vienna (1815) guarantees the neutrality of Switzerland. The president in 1912 was Dr. Louis Forrer (elected December 14, 1911); and the vice-president, E. Müller, who was elected December 12, 1912, to be president for the ensuing year.

HISTORY

WORKINGMEN'S INSURANCE. As was said in the 1911 YEAR BOOK the elections for the National Council were held on October 29, 1911. They renewed the representation in the council for three years, and the distribution of parties among the 189 deputies was as follows: Radicals, 113; Catholic Conservatives, 38; Liberals of the Centre, 14; Socialists, 15; Democrats, 5; belonging to no party, 4. Owing to changes in the electoral districts and to the dispute between Radicals and Liberals, the Socialists who, in the old National Council, had numbered only 5, now numbered 15, and their activity and influence in parliamentary affairs was more than proportionate to their number. They carried on a very vigorous campaign against the customs tariff, aiming at ultimate free trade. Public attention, however, at the beginning of the year was concentrated on the insurance law which, pursuant to a demand for referendum, was to be submitted to popular vote on February 4, 1912. This law for the insurance of workmen against sickness and accident had been under discussion for several years and was very carefully framed in order to meet the necessities of all concerned. Its chief features as regards sickness insurance were, the subvention of private and mutual insurance companies that already existed or might be formed in future, provided they conformed to certain rules, and the provision that while sickness insurance was not arbitrary, the cantons and communes should have authority to make it so within their jurisdiction. As to accident

insurance, employers were required to insure in a private or mutual insurance company, which was to be under the control of the Federal Council. The chief objections of the opponents to the measure were that it would establish a state monopoly and by the insurance of non-professional risks would impose a heavy and indeterminate financial burden. The law was favored by the Radicals, the Catholic Conservatives, and the Socialists. The Liberal party was divided on the question. Meetings to discuss the measure were held in all parts of the country and its merits and defects were thoroughly canvassed. Every elector received a copy of the bill. The referendum on February 4 gave the measure a large majority, 285,037 against 238,694.

SYNDICALISM. This is the name commonly applied to the most radical form of the modern labor movement. The name and to a large extent the social theory of the movement is derived from the French unions or *syndicats*. (See *TRADE UNIONS, France*.) It is a logical development of the revolutionary wing of socialism and the "Internationale" as represented by Baunin as against the evolutionary socialism of Marx and Engels. The term, however, has come to be indiscriminately applied to almost all labor movements that are inimical to peace and order. In its original French meaning the term applies to a movement of the organized workers in each industry to obtain control of that industry. It differs from socialism in that the latter would bring all industries under the common direction of the state. It agrees with socialism in desiring to get rid of the employer: it is even more extreme than socialism as to the productivity of capital, holding narrowly that labor produces all. See *SOCIALISM*. It would organize the workers industrially, that is, by industries rather than by trades or crafts; and it would get possession not by political means, that is, through parliamentary action or governmental control, but more directly. It holds that labor representatives in government are even worse than useless, for this leads to compromise, to a sacrifice of principles, and to false hopes of emancipation. It contends that the propertied class and the "intellectuals" will always control government; these latter, though not always biased, take a philosophical view of the class war and are content with mere reforms, with gradual progress. Syndicalism rejects reform because it does not go to the root of social ills; and it detests government because it is an instrument for the exploitation of the workers. It thus differs from political and evolutionary socialism which seeks control of parliamentary and administrative machinery by ordinary methods, which prides itself on its fruitfulness in social and industrial reforms, and which would make the state the controlling agency of all industries. In theory syndicalism ignores the existence of the state; it thus approximates philosophical anarchism. But in practice it finds the state as great an enemy as the employer and attacks both by its favorite devices. In England a most common meaning of syndicalism is such labor union activity as requires the intervention of the government in behalf of community welfare.

Syndicalism would gain control of an industry by direct action. This may be peaceful, as by the adoption of labor coöperation, or more

forceful, as by the strike, sabotage, boycott, label, and other means designed to render an industry unprofitable to an employer, forcing him to abandon it to the workers. The use of the general strike is identified with the syndicalist movement, the term being used in the double sense of a strike of all workers in a given industry or a strike of all workers in all industries. The general strike, however, is more of an ideal than a practical policy even with the syndicalists; it is a final culmination, a day of deliverance, for which workers must be in readiness. The irritation strike designed to continually annoy the employer has been adopted in Australia. Sabotage means the obstruction of the processes of manufacture by destruction of materials, by slow or bad work, and by crippling the machines; for example, by disturbing the regularity of railway traffic, scratching the varnish of furniture or placing emery powder in machinery bearings. The principle of direct action has come to be the distinguishing trait of syndicalism in the public mind. Its primary function in the syndicalist theory is to develop and maintain the spirit of aggressive class consciousness among the workers. It is in the struggles of the industrially organized workers with employers that they will learn their weakness and their strength and develop the cohesion and experience needed to manage industries themselves. In England the principle of direct action met with wide acceptance in labor circles during 1912. Though retaining the policy of political action the unionists were far from unanimous in rejecting the adoption of direct action. (See *TRADE UNIONS*.) In the transport workers' strike (see *STRIKES AND LOCKOUTS*) the theory of direct action was frequently expressed. Tom Mann and Ben Tillett, two radical labor leaders, were thoroughly imbued with revolutionary doctrines. The former said: "Labor runs the machine and labor will stop the machine until its demands are met." It was frequently noted that the appearance of syndicalism made socialism appear quite acceptable; but it may also be noted that syndicalism is by many looked upon as socialism's most bitter enemy. Not only does it scornfully reject the results of decades of socialist efforts and the present power of socialist members in legislative bodies throughout the world, but it draws to itself the most aggressive of the radical leaders whenever it appears. Two papers started in England are *The Industrial Syndicalist*, edited by Tom Mann, and *The Syndicalist Railwaymen*, edited by Charles Watkins. Mann, his publishers, and a contributor were convicted and sentenced on a charge of inciting to mutiny to terms of imprisonment, afterwards commuted. (See *GREAT BRITAIN, Syndicalism*.)

Both in England and Australia the syndicalists took advantage of the minimum wage movement. In England they declared that the profits of industry would warrant the payment of £2 per week to every worker regardless of capacity or output. In New South Wales the miners demanded 8s. per day and a 7-hour day for all men in and about mines. The granting of these was to be followed by higher demands and the constant use of the irritation strike until the employers gave up in despair and the workers came into full control of the industry.

In America the Industrial Workers of the World (q. v.) represent the nearest approach to syndicalism. They were prominent in the Lawrence and Little Falls strikes (q. v.). The dynamiting of the Iron Workers' Union (see *TRADE UNIONS*) was an extreme form of direct action, but was contrary to syndicalist policy, since it involved destruction of life. Moreover, the McNamaras sought not the overthrow of the present industrial system but the establishment of the orthodox trade-union policy of the closed shop.

SYNTHESIS OF FOODSTUFFS, ARTIFICIAL. See *CHEMISTRY*.

SYRACUSE UNIVERSITY. An institution for higher education at Syracuse, N. Y., founded in 1870. The total enrollment in all departments of the university in the autumn of 1912 was 3530 and the faculty numbered 260. Among the noteworthy changes in the faculty during the year were the appointments of Hugh B. Baker, M. F., Ec. D., as dean of the New York State College of Forestry; F. W. Howe, M. S., as director of the division of agriculture. The most important benefaction received during the year was a gift of \$83,000 from Mrs. Russell Sage for the division of agriculture. The productive funds of the university amounted to about \$2,000,000. The income from all sources in 1912 was \$547,600. The library contained 87,705 bound volumes and 41,627 pamphlets.

SYRIA. See *ARCHÆOLOGY*.

TAFT, ROYAL CHAPIN. Former governor of Rhode Island, died June 4, 1912. He was born in Northbridge, Mass., in 1823, and was educated at Worcester Academy. In 1849 he engaged in the business of manufacturing cotton and woolen goods and afterwards acquired large interests in several mills. He was president of many important financial institutions in Providence and elsewhere and was a director of the New York, New Haven and Hartford Railroad. He was for several years a member of the Providence city council, and was elected to the State House of Representatives in 1880, serving until 1884. He was elected governor of the State in 1888 and declined renomination to that office.

TAFT, W. H. See *PRESIDENTIAL CAMPAIGN AND UNITED STATES, Administration*.

TALL BUILDINGS. The approaching completion of two skyscrapers of record-breaking height and capacity in New York and the filing of plans for a new building of large dimensions to take the place of the Equitable building destroyed by fire during the year, gave unusual interest in 1912 to this field of architecture and structural engineering. The practical problems in regard to the construction and maintenance of these huge structures by this time had been well understood and mastered, and, in New York City at least, the matter was one rather to be considered on the score of economy and expediency in view of their erection on narrow streets without adequate daylight illumination and the concentration of business interests on limited ground areas and restricted districts. The evolution of the skyscraper in America has been rapid and along practical lines, the keynote always being utility. The architect has set conditions for the engineer and especially the elevator manufacturer to realize, so that the triumph is one rather of engineering than of design. As re-

gards ornament, this naturally is restricted and the best practice is considered to confine it in large measure to ground floors and entrances and to the attic stories, as here any original or monumental treatment is visible for great distances and gives the individual character to the building, rising as it does to great heights above or among its neighbors. Likewise the ornate entrance and entrance halls establish the character of the building to the man on the street and attract people by the degree and general nature of their decoration, these being in fact supplemental highways to the main street.

The skyscraper structurally is a skeleton construction of steel carried on a firm and massive foundation properly subdivided so that each vertical column will be properly supported. These vertical columns are cross connected by beams carrying the floors, adequate wind bracing is provided, and the whole metal structure is properly fireproofed. The exterior walls of brick or stone are carried by the main structure and are independent of the foundations. An efficient and adequate elevator system for vertical transportation is provided and then conveniences for the safety and ease of the tenants are provided in varying degree.

The primary structural consideration is the foundation, and in fact the engineering below the ground is quite as important and almost as costly as that which stands above it. That this must be firm to support the immense weight of the structure is manifest, and therefore it must be founded on bed rock or be of sufficient area to provide adequate bearing surface. Thus the New York City building code provided that "when foundations are carried down through the earth by piers of stone, brick, or concrete caisson the loads on same shall be not more than fifteen tons to the square foot when carried down to rock; ten tons to the square foot when carried down to firm gravel or hard clay; eight tons to the square foot in open caissons or sheet pile trenches when carried down to rock." For such a structure as the fifty-five-story Woolworth building in New York City with an estimated weight of 125,000 tons the foundations consisted of piers which necessarily were carried to bed rock reached at a distance of 110 feet below the sidewalk. This, as in the case of similar foundations, was possible by the use of pneumatic caissons such as are used for bridge construction where excavating under compressed air and loading the caissons they could be worked down to the solid rock and filled with concrete.

In another notable case, the New York Municipal building, the solid rock was considerably in excess of 115½ feet below tide level at which the limiting pressure of fifty pounds set by New York statute for compressed air-workers was encountered. Accordingly here no foundations were sunk below 112 feet, 1 inch below tide level and where rock failed a broad concrete foundation was built with the bearing surface so spread out that a maximum pressure of six tons to the square foot was obtained.

From the foundation pier each column or pair of columns rises, being supported on ribbed bases of cast iron laid directly on the concrete or on a grillage of steel beams or a cantilever structure of girders. The columns are built up of steel, successive lengths being riveted on as they are hoisted into place as

they come from the storage yard. Each section has been carefully trimmed and punched at the factory and the task of erection proceeds rapidly. To the columns are riveted the girders and to these in turn the floor beams, the temporary bolts being replaced by rivets which are set in place by pneumatic or electric hammers. Braces connect columns, girders, and beams while wind bracing, especially in tower buildings, is provided after careful computation to withstand stresses; these being figured usually on a maximum wind pressure of 30 pounds to the square foot. The entire structure therefore is firmly united into a homogeneous skeleton of adequate strength and the steel forms an appreciable fraction of the entire weight carried by the foundations.

Mention might be made of the steel itself which is fabricated in the special shapes and sizes desired at the mills, built up into columns and girders, accurately trimmed, fitted and punched and then stored at some convenient point to the place of erection. Most large cities do not permit the use of the streets for the storage of materials, and consequently it must be transported to the building as needed, hoisted into position and then bolted with a minimum expenditure and waste of time. This is done by steam or electric cranes which are mounted successively on upper floors as the building progresses and are able to handle the material rapidly and efficiently.

Given the skeleton the next consideration is making it fireproof, for the steel unprotected yields readily to heat, and failure in any single part can impair the entire structure. Likewise the spaces between the beams must be filled with brick, tile, or concrete, in order to finish the floors while the exterior walls, of brick or stone, which are mainly for ornament, must be added. The protection of the columns, girders, and beams may be secured by enclosing them completely in hollow tile, brick, or concrete, or by coating them with the more recent cement gum.

The relative merits of these and other methods of fireproofing, as well of course as the construction of the floors either by tile or brick filling or by reinforced concrete, are matters of controversy, but the opinion of disinterested engineers who have examined buildings exposed to conflagration dangers is that quality of work is more important than any particular kind of construction. This subject in 1912 formed an important topic of discussion in connection with the adoption of the new building code for the city of New York, as the various interests were in conflict as regards the rules governing the use of different materials and no decision was reached by the end of the year.

With frame and floors constructed the next question is the enclosure of the building. This is where the architect is permitted to have the predominant influence. The material and its ornamentation naturally make for the appearance of the building. It may be of brick, tile, or stone, and the effect is usually of solidity so that a tower, for example, rises as a massive monument. By some architects this is not considered appropriate, as they believe that the material and treatment should more accurately represent the actual construction and that lightness rather than massive appearance should be sought. Furthermore, in case

of fire it is the stone and the carving and ornamentation that suffers most, as it will be cracked and spalled even while resisting heat. But be that as it may, we find skyscrapers built of various materials, from brick to limestone and the more costly marble. These exterior walls are carried in curtain form on the main steel structure, and while they diminish in thickness as the height increases they are independent of foundation walls.

Within the building the means of access plays an important part. A city street virtually is swung around to a vertical position and of course there must be adequate transportation facilities, some of the larger buildings housing as many as 10,000 tenants, not to mention those coming and going for business or other purposes. Accordingly vertical transportation must be arranged and must be considered in the earliest plans. Elevators must be provided and distributed to handle the traffic speedily and economically, and these must be arranged with regard to certain vertical columns for their support and guide rails. These elevators are enclosed in fireproof and independent shafts with wire glass doors and panels on the sides, where they give access to the floors and must be independent of the stairways, which in a tall building are considered rather for emergency use than as a practical means of communication. But it is the elevators that make the tall building possible and it is the elevator engineer who has to realize the demands of architects and builders. So far every exaction has been met and with the successful development of electric machines, notably of the traction pattern, the various heights have been reached. The traction elevator consists essentially of a car whose cable after passing around a sheave on an electric motor is connected to a balancing counterweight. As the weight of the cable is compensated by a flexible chain the only work for the motor in addition to moving the system is to raise or lower the load provided by the passengers. This can be done at a speed of 700 feet per minute, so that express cars can be run to the highest floors in a minute or less, this time being the practical limit from the standpoint of renting availability. With the elevators provided and suitably protected a tall building requires proper subdivision of the floor space. The stairways in a separate fireproof shaft must be cut off at each floor by fireproof doors so as to avoid being a chimney to carry fire through a building. Floor space must be restricted to suitable fireproof partitions and all trim, doors, etc., must be made of metal, the tenants supplying, as it is, far too much combustible material in the way of furniture, books, records, etc. For the fire danger is always present and there must be adequate standpipes constantly under pressure for instant use. In addition sprinklers and fire alarms must be installed and the vast network of wires required for light, power, and communication must be carried in suitable conduits and distributed from proper panels and switchboards. Water supply and plumbing of a most elaborate character extend throughout a modern skyscraper and a heating system susceptible of exact regulation. In fact the maintenance and economy of such a building is no small problem and the superintendent is in most cases a mechanical engineer graduate from a leading technical school.

The skyscraper, aside from its structural and insurance features, is furnishing a great problem to American cities. It tends to concentrate business interests and thus prevent the more even distribution that many claim would benefit real estate at large. It deprives the owners of adjoining property of air and daylight, as such buildings are usually constructed on the narrow and older streets of a city. It has been proposed that the area covered by any portion of a building rising to extreme height should be limited by law so as to restrict the aggregate amount of high buildings, yet permit of lofty towers. While extreme examples of tall buildings are seen in New York City, the tendency is general throughout the United States, and many large corporations even in smaller cities have erected such buildings, securing not only adequate returns therefrom, but also the valuable asset of the prestige associated with the occupation and ownership of such a structure. In fact many of the large life insurance companies owning these lofty and monumental structures esteem their advertising value of the highest importance.

Five of the tallest buildings in the world at the end of 1912 were in New York City: Woolworth building, 775 feet; Metropolitan Life Tower, 700 feet; Singer building, 612 feet; New York City Municipal building, 580 feet; Bankers Trust Company building, 540 feet; The L. C. Smith building in Seattle, and the Union Central Life Insurance building in Cincinnati are also notable buildings.

TAMMANY HALL. See PRESIDENTIAL CAMPAIGN.

TANAGRA. See ARCHÆOLOGY.

TARIFF. Ever since the enactment of the Payne-Aldrich law of 1909 the tariff has been a foremost subject of political and economic discussion. So general has been the demand for reduction that almost no conspicuous political leaders have openly defended the existing rates. The Republican party in its political platform, however, argued mainly for the protective system, though admitting that "some of the existing import duties are too high and should be reduced." It contended that reductions should be gradual and on the basis of accurate information. The Democratic platform declared tariff duties unconstitutional and denounced the contention that the tariff system is favorable to labor. It declared protection to be "the principal cause of the unequal distribution of wealth"; it favored an immediate downward revision, but in such manner as not to injure or destroy legitimate industry. The Progressive party platform declared in favor of the protective system, but demanded tariff revision. Like the Republican party it pledged itself for a non-partisan scientific tariff commission. Much attention was given to the subject in Congress, but no legislation affecting duties resulted. The tariff board, for which President Taft had valiantly contended throughout his administration, was eliminated because the House Democrats refused an appropriation for its continuance. The various bills and reports noted below were introduced, but the efforts of all three groups to gain political advantage, before the country, assisted by the President's vetoes, checkmated each other effectually. In general the conservative Republicans either refused to do anything or took an

attitude of indifference, while the Progressive Republicans favored reductions, but to a less degree than did the Democrats.

PRESENT TARIFF. The import duties as established by the Payne-Aldrich tariff of 1909 were classified under fourteen schedules, A to N inclusive. These schedules contain 480 paragraphs each relating to a group of articles or a single article. Schedule A includes chemicals, oils, and paints. Among the articles there included are drugs, with a duty of $1\frac{1}{4}$ cents a pound and 10 per cent. ad valorem; glue; castor oil; olive oil; whale oil; opium; phosphorus; perfumery, and cosmetics; and soap. A majority of the duties are specific, but many are a combination of both specific and ad valorem as illustrated by drugs. Schedule B includes earthenware and glassware; these comprise also cement, marble, sponges, etc. Most of these have only ad valorem duties. Schedule C, including metals and manufactures of metals, contains iron ore; iron in pigs and bars; automobiles and parts; horseshoe nails, copper plates; pens; table and kitchen utensils; tin plates; pins; and manufactures of iron. Nearly all of these have specific duties, though manufactured articles are likely to have ad valorem duties. Schedules D includes wood and its manufactures; and schedule E, sugar, molasses, and their manufactures. Sugar pays duties according to weight and degrees of quality as shown by the polariscope test. Its rates are the same as under the Dingley act of 1897, being approximately one cent per pound. Schedule F includes tobacco and manufactures of tobacco, the duties on manufactured tobacco ranging from \$1.85 to \$2.50 per pound, on snuff 55c per pound, and on cigars and cigarettes \$4.50 per pound plus 25 per cent. ad valorem. Schedule G, agricultural products and provisions, includes cattle, horses, mules, barley, oats, rice, rye, butter and cheese, eggs, hay, honey, hops, potatoes, fish, fruits, and salt. Nearly all of the rates of this schedule are specific. Schedule H includes spirits and wines. Proof alcohol pays \$2.60 per gallon; brandy, gin, whisky, and cordials, proof, pay the same; wines, including champagne, \$9.60 per dozen quarts; still wines pay much less; and malt liquor 45 cents per gallon. Schedule I includes cotton manufactures. It is made very complex not only by frequent combinations of both specific and ad valorem duties, but also by the classification of articles according to number of threads, their coloring, and other qualities. Thus the duties on cotton thread, colored and bleached, range according to numbers from 6 cents per pound to 67 cents per pound. Cotton handkerchiefs pay duties of $4\frac{1}{4}$ cents per square yard and 10 per cent. ad valorem; cotton hosiery, 70 cents to \$2.00 per dozen pairs plus 15 per cent. ad valorem; cottonshirts and drawers from 60 cents per dozen pairs plus 15 per cent. ad valorem to \$2.25 per dozen pairs plus 35 cents ad valorem. Schedule J comprises flax, hemp, jute, and their manufactures. Schedule K includes wool and woolens. Wool is divided into three classes with subdivisions, the rates ranging from 33 cents to 3 cents a pound; dress goods pay duties ranging from 7 cents per square yard plus 50 per cent. ad valorem to 11 cents a square yard plus 55 per cent. ad valorem; blankets, 22 cents a pound plus 30 per cent.

ad valorem to 44 cents a pound plus 55 per cent. ad valorem; clothing and carpets have similar combinations of both specific and ad valorem duties. Schedule L covers silk and silk goods; schedule M includes pulp, paper, and publications; and schedule N includes sundries. Among the latter are agricultural implements, beads, brushes, bristles, bituminous coal, coke, toys, feathers, prepared furs, human hair, manufactures of leather, gutta-percha, musical instruments, paintings and statuary, and umbrellas.

The law of 1909 placed 236 articles on the free list. Among the articles on this list are the following: Animals for breeding, exhibition, or racing; birds, land, and water fowl; books, maps, music, and publications issued for subscribers or exchanges by scientific and literary associations or academies or publications for gratuitous private circulation; public documents of foreign governments; books and pamphlets in raised print; books, maps, and music especially imported in very limited numbers for the use of a religious, philosophic, educational, or scientific society; rough or uncut diamonds or other precious stones; undressed furs; guano; hides of cattle; india rubber; models of invention; needles; petroleum, crude or refined, and its products; crude paper stock; philosophic and scientific apparatus for cultural uses; crude potash; professional books, implements, and instruments; tobacco stems; woods when in logs; and works of art.

TARIFF BOARD. Throughout his administration President Taft stood for revision of the tariff on the basis of the findings of a tariff board or commission. His principle in the campaign of 1908 had been that protective duties should be made on the basis of differences in cost of production at home and abroad. Consequently he from the first demanded a board of investigation to determine relative costs. The Payne-Aldrich act authorized such a board; and against much opposition appropriations for its work were secured for 1910-11 and 1911-12. The House Democrats, however, refused further appropriations and the life of the board terminated in June, 1912. The press of the country accepted this outcome calmly, partly because it was expected that the functions of the board would be transferred to a new bureau of foreign and domestic commerce in the Department of Commerce and Labor. It was quite widely conceded that the board had done faithful and valuable work; that it had shown the necessity of revision downward; but that the task assigned it of determining differences of cost of manufacture was insuperable. Democratic opposition was due to their belief that the board had been made an excuse for preventing tariff legislation. Nevertheless the board did much to show that high costs and high wages do not uniformly go together; and to bring into question the traditional Republican argument that protection is the cause of the high wages of American labor.

RECIPROCITY. The Canadian reciprocity treaty which was passed by a special session of Congress in 1911, but not accepted by Canada, provided that whether Canada approved the agreement or not, print paper and wood pulp upon which there were no export restrictions should be admitted free from Canada. Following the enactment of that provision,

Norway, Sweden, Denmark, Germany, and Austria claimed that their paper and wood pulp should likewise be admitted free under the "most favored nation" clause of their commercial treaties. In 1911 Germany sent to the United States 70,000 tons of wood pulp valued at \$3,000,000. Moreover, Germany took occasion to admit steel from Sweden at rates more favorable than those imposed upon American steel, defending her action on the ground that she was dealing with Swedish steel as Congress dealt with Canadian wood pulp. Such facts as these made urgent either the repeal of the provision or the extension of a similar privilege to all countries desiring to export wood pulp and print paper. Nothing, however, was done, in spite of considerable agitation.

IRON AND STEEL. The Democrats of the House had intended to deal with the wool schedule first, but on account of the report of the tariff board submitted late in December they turned to the metals schedule as most available for immediate revision. On January 26 the committee on ways and means of the House reported a bill reducing rates on iron and steel products by 30 to 50 per cent. This was passed by the House three days later. It put iron ore on the free list, as also various products controlled by monopolies, including sewing machines, cash registers, and linotype machines. It also placed on the free list agricultural implements and various articles of common use such as nails and barbed wire. It placed duties of 8 per cent. on pig iron and 10 per cent. on steel rails, and made large reductions in the duties on structural shapes and other heavy products. Cutlery was given a rate of 35 per cent. These reductions were supported by various reports, especially that of the Commissioner of Corporations on the steel industry, which had just been issued, but also by the reports of the immigration commission and the Bureau of Labor dealing with the steel industry and by hearings before committees of the House. The figures of international trade, showing the ability of American producers to compete in foreign markets, were used to show that reductions were warranted. When the measure reached the Senate it met the opposition of both wings of the Republicans. The conservatives took refuge behind the fact that a tariff board report on the industry had not been made. The Progressive Republicans brought forward a measure on April 29 intermediate in its proposals. The House bill shifted the basis of the duties from specific to ad valorem rates, the average being estimated at 19 to 22 per cent.; existing rates average about 33 to 37 per cent.; the Progressive Republican bill averaged about 25 per cent. Moreover, the latter bill retained the specific duties used in the existing law. A compromise bill was passed by both houses, but vetoed by the President on the ground that the tariff board had made no report on the steel schedule, and that the proposed duties furnished insufficient protection. This veto was overridden in the House by a vote of 173 to 83, but sustained in the Senate on August 16 by a vote of 32 to 39.

CHEMICAL SCHEDULE. On February 16 the committee on ways and means reported a bill for the revision of the chemical schedule with a view to increased revenues. This was the first general revision of that schedule since

1883 and required the rearrangement of paragraphs, and the renaming of numerous commodities. The rates were considerably altered. Contrary to Democratic rule, ad valorem duties, however, were used only to a small extent, owing to the more ready application of specific rates. Chemicals cannot be readily tested at time of importation, with the result that ad valorem duties encourage the importation of high grades under the guise of low grades. The report accompanying the bill showed that, between 1900 and 1910, 4068 patents relating to chemical industries were issued by the Patent Office, of which 62 per cent. were secured by foreigners. Foreign holders of American patent rights are not required to manufacture their products in this country; they thus have a monopoly of their products sold here. Consequently the tariff on such products in no way benefits the American producer, who cannot compete for lack of patent rights. Moreover, the industry was found to be closely organized so that prices generally were not on a competitive basis. For these reasons large reductions were believed warranted. The House bill failed to pass in the Senate.

WOOL. A report of the tariff board on wool and woollens in four volumes was transmitted to Congress by President Taft December 21, 1911. It was commended as summarizing a vast amount of information, but criticised for duplicating material already available elsewhere. Opinion varied widely as to the value of cost estimates contained in it. After an extensive study of this report the ways and means committee of the House filed on March 27 a thorough criticism of it. This criticism began by rejecting the cost of production theory upon which the tariff board had operated. It declared that costs, meaning thereby expenses of production, do not show accurately the competitive power of different countries. Moreover, the difficulties of ascertaining true money costs were held to be insuperable. Besides the House Democrats declared that the tariff board had not separated the cost of producing wool from that of producing mutton nor presented any satisfactory method of treating the joint cost of these two products. The cost estimates of cloths were shown to be few in number and largely conjectural. They were ascertained by procuring sample fabrics abroad which were then sent to American manufacturers for estimates of cost of production. Extensive variations in cost due in part to faulty statistical methods were shown to undermine the validity of the cost of production basis of comparison. Though the board's report seemed to warrant the conclusion that raw wool should be free, the committee found evidence to warrant a duty of 20 to 25 per cent. ad valorem. In other respects also the committee found that the duties proposed in the Underwood bill of 1911 were largely sustained by the board's report.

The House Democrats therefore reenacted the Underwood bill of 1911. In the Senate a substitute bill proposed by Mr. Penrose was passed in the committee of the whole on July 25, this bill having, it was said, been approved by the President. Senator La Follette moved the enactment of his bill of 1911 and it was accepted. There followed a conference between House and Senate leaders and the enactment by both houses of a bill substantially the same as that

passed in 1911. This, however, was vetoed by President Taft on the ground that it authorized reductions greater than the board's report justified. He declared, however, that he would approve a bill making less excessive reductions. The original bill was passed over the President's veto on August 13 by the House by a vote of 174 to 80, twenty-one Republicans voting in the affirmative. In the Senate the vote was only 39 for to 36 against, the veto thus being sustained.

COTTON. On March 28, the report of the tariff board on cotton manufactures was sent to Congress by the President. In an accompanying message he found that it would warrant very considerable reductions of duties and urged action to that end. This report made no study of raw materials, that being considered unnecessary. It made some estimates of the costs of yarns in the United States and in Lancashire mills. Also efforts were made to determine the cost of producing sample fabrics, the results being based on the estimates of manufacturers. It found the differences in the costs of yarns to equal about three to fifteen per cent. of the mill costs of producing such yarns in Great Britain. It set forth certain practices of jobbers and dealers whereby prices are maintained; thus notwithstanding the fact that the costs of production in American mills sometimes are less than costs abroad, selling prices here are uniformly higher. The report warranted the conclusion that in all but the very finest grades of cotton goods no protection was needed.

In June the House committee on ways and means presented a criticism of this report. The committee declared the report incomplete because it dealt with only one-third of the schedule; and therefore it was impossible as a basis for revision. The committee laid special stress on the absence of accurate figures of cost of manufacture here and abroad. It contended that the estimates of cost for yarns were not authoritative. It found that the board had actually abandoned the idea of comparative costs for that of comparative wholesale prices as a basis for rate making. Thus the selling prices of samples were obtained in Great Britain; these samples were then submitted to American mills for estimates. The committee contended that the report showed the difference in yarn costs to be slight; that cheaper grades cost no more to manufacture here than in Great Britain; but that on fancy cotton cloths, knit goods, underwear, and hosiery some protection was warranted. A bill carrying out these ideas was passed by the House and about the middle of August by the Senate. It, however, was vetoed by the President.

SUGAR. The Democratic leaders of the House sought to place sugar on the free list. They succeeded with the aid of 24 Republicans in passing a bill on March 15 to this effect. The resulting loss of more than \$50,000,000 in revenue was made up by a new excise tax passed four days later. (See **TAXATION**.) The Senate, however, substituted a bill providing for only moderate reduction of duties together with alterations in the mode of application. No agreement being reached in conference, both the Free Sugar bill and the Excise bill were lost.

TARKHAN. See **ARCHAEOLOGY**.

TARR, RALPH STOCKMAN. An American geographer and educator, died March 21, 1912. He was born in Gloucester, Mass., in 1864, and graduated from the Lawrence Scientific School in 1891. In 1882 he was assistant to the United States Fish Commission and Smithsonian Institution. He was assistant geologist in the Texas Geological Survey in 1888 and 1891. In 1890 and 1891 he was assistant in geology at Harvard University. From 1892 to 1906 he was a member of the faculty of Cornell University as assistant professor of geology and professor of dynamic geology and physical geography. From 1906 until the time of his death he was professor of physical geography at Cornell. He acted also as special field assistant of the United States Geological Survey. He wrote widely on geological and geographical subjects. Among his published works are: *Economic Geology of the United States* (1893); *Elementary Physical Geography* (1895); *Elementary Geology* (1897); *First Book of Physical Geography* (1897); *Tarr and McMurry Geographies* (1900, 1902); *Physical Geography of New York State* (1902); *New Physical Geography* (1904). He also wrote many monographs on geographical and geological topics. He was associate editor of the *Journal of Geography*.

TASMANIA. An island south of Victoria, constituting a state of the Commonwealth of Australia. Area, 26,215 square miles. Population (census of April 3, 1911), 191,211, exclusive of full-blooded aborigines. Hobart, the capital, had 27,526 inhabitants; with suburbs, 39,937. Governor in 1912, Maj.-Gen. Sir Harry Barron, appointed to be governor of Western Australia in 1913; premier, A. E. Solomon. See **AUSTRALIA**.

A new cabinet was formed in June under Mr. A. E. Solomon as premier.

TAXATION. The development of the taxation in recent years has tended to take more and more the direct forms of income, inheritance, and land increment taxes. At the same time the traditional general property tax is being generally superseded by the taxation of realty separately and the extension of taxes on corporations. Nevertheless Ohio, in its new constitutional reform retained the general property tax. In Germany, England, Oregon, Washington, the Canadian Northwest, and China the movement for the taxation of the unearned increment of land has received wide acceptance and increasing adoption. In New York City this policy was actively discussed during the year, particularly as a means of relieving congestion of population as well as the burdens of the poor. The proposal for income taxation gained wider acceptance; the propaganda for the uniform inheritance tax law which New York adopted in 1911 was carried forward; and administrators and scientific students of taxes continued the discussion of the problem of separating national, State, and local taxes and forming them into a just and supplementary whole.

INCOME TAX AMENDMENT. A joint resolution of Congress adopted in 1909 proposed an amendment to the Constitution authorizing Congress to levy a tax on income "from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration." This had been approved at the close of 1912 by the following

34 States: Alabama, Arizona, Arkansas, California, Colorado, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, South Carolina, South Dakota, Tennessee, Texas, Washington, Wisconsin. Only 4 States had finally rejected the amendment: Connecticut, New Hampshire, Rhode Island, and Utah. The ratification of 36 States was necessary for its adoption.

CORPORATION TAX. The federal corporation tax law of 1909 provided that insurance companies should pay excise taxes equal to one per cent. of their annual net income exclusive of dividends from the stock of other corporations. The law defined in particular the methods of determining the net income. Suit was brought early in 1912 by the Mutual Life Insurance Company of New Jersey in the United States District Court on the grounds that the law was wrongly interpreted when dividends paid to its policy holders were included within the net income. The court decided in favor of the company, holding that dividends are not "income received," and that expenditures for replacing furniture, etc., are expenses and not investments. It was the lay opinion that the court thus exempted insurance companies from the burden which Congress probably sought to place upon them, but that in so doing it had reasoned logically from the nature of the corporation tax.

DEMOCRATIC INCOME TAX PROPOSAL. A bill known as the Excise bill, presented by the House committee on ways and means in February, provided that the loss in revenue resulting from the proposed removal of the duty on sugar should be made up by a federal income tax. This tax assumed the form of an excise tax to make it harmonize with the ruling of the Supreme Court on the corporation tax in 1911. This decision upheld that tax as "an excise on the privilege of doing business as a corporation." The new proposal therefore was to levy a "special excise upon doing business by copartnerships or individuals." All incomes of \$5000 and less were exempted; as were also incomes affected by the corporation tax. The old method of self assessment rather than the stoppage-at-source method was retained. The rate was one per cent. The tax was estimated to yield \$60,000,000, but Republican Congressmen declared it would yield less than half that sum. Though passed by the House, and by the Senate with various encumbrances, it was a part of the unfinished business at the close of the session.

WISCONSIN. In 1911 Wisconsin enacted a progressive income tax law. This exempted all personal property, except farm animals and merchants' and manufacturers' stock; applied the principle of stoppage-at-source; authorized the taxation of corporations under a separate set of progressive schedules; and made the following exemptions: For an individual \$800, for a husband and wife \$1200; for each child under 18 or other dependent person \$200. The constitutionality of this law was upheld by the Supreme Court of the State on every point. The court denied the soundness of the arguments that the progressive features were unreasonably discriminating, led to double taxation, and deprived citizens of the equal protection of the

laws. It found progressive taxation specifically authorized by the State constitution, which provides that "taxes may also be imposed on incomes, privileges, and occupations, which taxes may be graduated and progressive, and reasonable exemptions may be provided." The court held the progressive features not only constitutional, but also economically sound. Similarly it held the exemption features to be not only essentially reasonable, but well within legislative discretion. Finally the separate rates for corporations were held justified because of the privileges which corporations exclusively hold and the differences between a corporation and an individual in business.

BIBLIOGRAPHY. Among the new books were the following: *State and local taxation. Addresses and proceedings*, fifth annual conference under the auspices of the National Tax Association, held at Richmond, Va., September 5-8, 1911; J. Orr, *Taxation of land values as it affects landowners and others*; L. F. Post, *Outlines of lectures on the taxation of land values*; Paul Leroy-Beaulieu, *Traité de la science des finances*; W. V. Marshall, *Curb to predatory wealth*; Vineberg, *Provincial and local taxation in Canada*; P. V. Ross, *Inheritance taxation*; C. F. W. Dassar, *Treatise on the law of taxation*. Mention should be made also of articles by Professor E. R. A. Seligman on "Recent tax reforms abroad" in the *Political Science Quarterly* for September and December.

TAYLOR, SIR ALEXANDER. An English soldier, engineer, and educator, died February 24, 1912. He was born in 1826. He entered the army, and in 1845 went to Calcutta as a subaltern of the Bengal Engineers. He took part in several battles from 1845 to 1849, chiefly in the capacity of engineer. In 1857 he joined the force before Delhi as second-in-command of the engineers. On several occasions he penetrated alone and in daylight through the enemy's outpost and made a detailed study of the defenses. His plan of attack was finally adopted. During this siege he was severely wounded. Following the relief of Delhi he was employed in quieting the surrounding districts. He commanded the Bengal Engineers in the siege and capture of Lucknow, where he was again wounded. He also commanded the engineers in the Umballa campaign of 1863. In 1865 he was appointed chief engineer and secretary to the Punjab government and in the last two years of his Indian service was deputy inspector-general of military works and president of the Indian defense committee. From 1890 to 1896 he was president of the Royal Indian Engineering College. This institution was abolished several years before his death. He was made a general in 1878. He received several medals and decorations for gallantry in action.

TAYLOR, EZRA B. An American public official, former member of Congress from Ohio, died January 29, 1912. He was born in Nelson, O., in 1823, and received an academic education. He was admitted to the bar in 1845 and served as prosecuting attorney for Portage County. From 1877 to 1880 he was judge of the court of common pleas. He was elected to the Forty-sixth Congress in 1880 for the unexpired term of James A. Garfield and was re-elected to the Forty-seventh and Fifty-second Congresses inclusive (1881-1893).

TAYLOR, ROBERT LOVE. United States

Senator from Tennessee, died March 31, 1912. He was born in Carter County, Tenn., in 1850. His early days were spent on the farm of his father, but even at the outset of his career politics were his chief interest. In 1878 he was elected to the Forty-sixth Congress. He made a unique campaign for election during which he played the violin and sang the old folk songs of the mountains. By this means he won the title of "Fiddling Bob," which clung to him for life. After serving in the House of Representatives for one term he became pension agent at Knoxville, Tenn. He was elected governor of Tennessee in 1886 and was re-elected in 1888. He was again elected governor in 1896. In this campaign he pursued the same tactics which had proved so popular when he was elected to Congress. For several years he retired from politics and appeared on the lecturing platform. His most popular lecture was entitled "The Fiddle and the Bow." This he delivered hundreds of times in all parts of the United States. In the Democratic primary election in 1906 he was nominated for the United States Senate and was elected to this office in January, 1907, by an almost unanimous vote of the legislature.

TAYLOR, SAMUEL COLERIDGE. An English composer, died August, 1912. He was born in London in 1875. His father was a doctor of medicine, a native of Sierra Leone, and his mother an English woman. In 1891 he entered the Royal College of Music as a student of the violin, studied composition with Sir Villiers Stanford, and in 1893 gained a composition scholarship. In 1898 the first part of his *Hiawatha* trilogy, *Hiawatha's Wedding Feast*, was produced at the Royal College. The second part, *The Death of Minnehaha*, was brought out at the North Staffordshire Festival in 1899, and the third, *Hiawatha's Departure*, by the Royal Choral Society in 1900. In the May following the overture for the whole trilogy was heard for the first time. He wrote incidental music for many of the plays produced by Sir Herbert Beerbohm Tree. This included accompaniments to the dramas, *Herod*, *Ulysses*, *Nero*, and *Faust*, all by Stephen Phillips. In 1904 he became conductor of the London Handel Society. He was best known in the United States through his choral work. He was the most important of colored musical composers and one of the best known of modern composers.

TELEGRAPHY. The deferred message form of day and night service inaugurated in 1910 has stimulated the use of telegraphic facilities to a marked degree. The number of messages of this class handled in 1912 was in excess of 20,000,000. There has been an extensive introduction of switching devices whereby operators are enabled to switch their table instruments from circuit to circuit in response to lamp signals. These have been extensively utilized in the British service and in the London main office save the daily repetition of 18,000 through messages. In America the transmission of 90 per cent. of all messages is done manually, despite the development of a number of types of automatic and printing devices. In cable telegraphy transmission is largely accomplished by perforated strips of paper and mechanical senders.

TELEGRAPHY AND TELEPHONY,

1912—45

WIRELESS. See **WIRELESS TELEGRAPHY AND TELEPHONY.**

TELEPHONY. Telephonic progress has turned from the direction of new appliances to the more emcient use of existing facilities. Important aspects of this progress in 1912 were the great extension in the use of Pupin loading coils, the completion of a loaded network of high transmission efficiency connecting all important centres east of the Rocky Mountains, and the unification of telephone and telegraph circuits. The radius of long distance transmission still reaches from the Atlantic seaboard to Denver, but plans for the extension of the circuits point to transcontinental transmission in 1914. The automatic systems have made little advance in direct use, but the Bell interests have acquired extensive patent rights in this field and are making preparations for a considerable use of semi-automatic operation, particularly in handling incoming trunking calls, that is calls for connection to an exchange other than the one to which the calling party is connected. Automatic systems have received more attention in Europe than in America, as government ownership tends to make the elimination of the operator more important than here.

The 450-mile cable system between Boston and Washington was practically completed during the year. The cables represent the highest advance in phantom operation, or the employment of a pair of basic metallic circuits as a third circuit, giving three circuits from four wires. This installation was undertaken primarily to eliminate the interruption of service on overhead lines attendant upon accidents and adverse weather conditions. The new French cable crossing the English Channel is an interesting example of continuous loading. The main conductors are surrounded by a close helical layer of fine iron wire, so distributed as to completely compensate for the electrostatic capacity of the cable. Its working results have been excellent. The tendency of the American telephony industry to become concentrated entirely under the Bell system has continued unabated. The most noteworthy transfer of control in 1912 was in the case of the extensive Bay Cities Home Telephone Company operating in the San Francisco district. An important aspect of telephone progress was the establishment of a complete pension and sick benefit system by the Bell interests. A fund of \$10,000,000 was set aside for the purpose and 175,000 employees are included in its benefits.

The following table shows the number of telephones and miles of wire on January 1, 1912:

	Telephones Jan. 1, '12			Wire Jan. 1, '12		
	Number	P.C.		Miles	P.C.	
	inc.			inc.		
	(partly over to			(partly over to

TENNESSEE. POPULATION. According to the Census Bureau statistics compiled during 1912 out of the total population, 2,184,789, the foreign-born whites numbered 18,479, compared with 17,586 in 1900. Of these, the largest number, 3870, came from Germany; from Russia, 2494; from Ireland, 2281; from Italy, 2025; and from England, 2036. Other European countries were represented by smaller numbers. The negroes in the State in 1910 numbered 473,088 and the mulattoes, 118,697. In 1890 the negroes numbered 430,678 and the mulattoes, 74,463.

COAL. The production of coal in the State in 1911 was 6,433,158 short tons, valued at \$7,209,734. This was a decrease from the output of 1910, which was 7,121,380 short tons, valued at \$7,925,350. The output in 1911, however, was larger than that in 1909, and exceeded that in any preceding year except 1907.

The production of blister copper in the State in 1911 was 18,965,143 pounds, compared with 16,691,777 pounds in 1910. The entire output was from the Ducktown district, located in the extreme southeastern part of the State. This district was one of the earliest large producers in the country. At the close of 1911 the total output was approximately 230,660,000 pounds.

The production of iron ore in the State in 1911 amounted to 469,728 long tons, valued at \$632,339, compared with a product of 732,247 long tons valued at \$1,048,323.

AGRICULTURE. The acreage, value, and production of the principal crops in 1912 are given in the following table:

		Acreage	Prod. Bu.	Value
Corn	1912	3,332,000	88,298,000	\$53,862,000
	1911	3,400,000	91,120,000	55,583,000
Wheat	1912	674,000	7,077,000	7,077,000
	1911	720,000	8,280,000	7,949,000
Oats	1912	258,000	5,599,000	2,632,000
	1911	315,000	6,142,000	3,071,000
Rye	1912	17,000	196,000	192,000
	1911	19,000	226,000	224,000
Potatoes	1912	38,000	3,344,000	2,341,000
	1911	38,000	1,558,000	1,683,000
Hay	1912	888,000 a	1,154,000	18,233,000
	1911	400,000 a	400,000	6,680,000
Tobacco	1912	110,000 b	72,600,000	5,155,000

MANUFACTURES. The Thirteenth Census statistics are for the calendar year 1909, and were compiled in 1912. Tennessee is preëminently an agricultural and mining State, and its manufactures are based largely on its rich mineral resources. From the table in the next column it will be seen that in 1909 there were 4609 manufacturing establishments, giving employment to 87,672 persons.

The value of the product was largest in the lumber and timber industries, \$30,457,000; in the manufacture of flour-mill and grist-mill products, \$29,070,000; in foundry and machine-shop products, \$9,190,000; in printing and publishing, \$7,173,000; in industries connected with railways, \$6,777,000. The total number of persons employed in manufacturers in 1909 was

	Number or Amount 1909	1904	P. C. of Inc. 1904-'09
Number of establishments	4,609	3,175	45.2
Persons engaged in manufactures....	87,672	69,287	26.5
Proprietors and firm members...	5,415	3,805	42.3
Salaried employees	8,417	4,910	71.4
Wage earners average number)...	73,840	60,572	21.9
Primary horsepower	242,277	175,780	37.8
Capital	\$167,924,000	\$102,439,000	63.9
Expenses	158,980,000	119,328,000	33.2
Services	37,438,000	27,886,000	34.3
Salaries	9,186,000	5,080,000	80.8
Wages	28,252,000	22,806,000	23.9
Materials	104,016,000	79,352,000	31.1
Miscellaneous	17,526,000	12,090,000	45.0
Value of products..	180,217,000	137,960,000	30.6
Value of products less cost of materials	76,201,000	58,608,000	30.0

87,672, of whom 77,277 were male and 10,395 female. The prevailing hours of labor for more than one-half the wage-earners were 60 a week. Nearly one-fourth of the total worked from 54 to 60 hours a week; 7.6 per cent. were employed in establishments where the prevailing hours of labor are less than 54 a week, and 15 per cent. in establishments where they are more 60 hours a week. The largest number of wage-earners was employed in Nashville, 9721; in Memphis were 7927, and in Chattanooga 6410. The value of the manufactures of Memphis was \$30,241,519; of Nashville, \$29,649,697.

EDUCATION. The school population of the State on June 30, 1912, was 756,966. Of these, 587,156 were whites and 169,810 were colored. The pupils enrolled numbered 539,991, of whom 438,603 were white and 101,309 were colored. In the elementary schools there were enrolled 441,163 pupils; in county high schools, 7546, and in city schools, 91,202. The total number of teachers was 11,367. Of these, 3220 were white male teachers, 5928 white female teachers, and the colored male teachers numbered 574 and colored female teachers, 1364. The average monthly salary of teachers was \$48. The total expenditures for schools was \$5,537,029.

POLITICS AND GOVERNMENT

There was no session of the legislature in 1912 as the sessions are biennial and the last was held in 1911. The date for the next session is January 6, 1913.

Elections were held for State officers on November 5. The Democratic State convention on May 6 elected 24 delegates to the national convention. Resolutions not to instruct the delegates were adopted. The convention also named 8 delegates-at-large who had been agreed upon by the campaign managers of Clark, Wilson, Harmon, and Underwood. Each of these delegates had half a vote. Governor Hooper was the Republican candidate for reelection and was indorsed by the independent Democrats, while the Democratic candidate for governor was Benton McMillin. The Hon. M. R. Patterson was nominated by the regular Democrats for United States senator, but later withdrew. The election of November resulted as follows: For President, Wilson received 135,399, Taft 60,674, Roosevelt 53,986, Debs 3482, and Chafin 834. Wilson's plurality was 74,720. For governor, McMillin, Dem., received 111,973 votes,

Hooper, Rep., 120,078, Poston, Soc., 4464, and Harold, Pro. 2702. The legislature contains 59 regular Democrats, 29 independent Democrats, 33 Republicans, and 11 Shelby County Democrats.

As the result of the death of Senator Robert L. Taylor (q. v.) it was necessary for Governor Hooper to appoint a successor to fill out his term. On April 2 he appointed Newell Sanders, a prominent manufacturer of Chatanooga, and chairman of the Tennessee Republican committee.

STATE GOVERNMENT. Governor, Benjamin W. Hooper, Rep.; Secretary of State, H. W. Goodloe, Dem.; Treasurer, George T. Taylor, Rep.; Commissioner of Agriculture, George Peck, Rep.; Superintendent of Education, J. W. Bristor, Dem.; Comptroller, Frank Dibrell, Dem.; Adjutant-General, Frank Maloney, Rep.; Attorney-General, Charles T. Cates, Jr., Dem.; Commissioner of Insurance, George T. Taylor, Rep.

JUDICIARY. Supreme Court: Chief Justice, John K. Shields; Justices, A. S. Buchanan, Grafton Green, M. M. Neil, and D. L. Lansden; Clerk, Joseph J. Roach—all Democrats.

STATE LEGISLATURE, 1913. Democrats, Senate 18, House 57, joint ballot 75; Republicans, Senate 6, House 22, joint ballot 28; Progressives, Senate 0, House 3, joint ballot 3; Independents, Senate 9, House 17, joint ballot 26. Democratic majority, Senate 3, House 15, joint ballot 18.

The representatives in Congress will be found in the article UNITED STATES, section Congress.

TENNESSEE, UNIVERSITY OF. An institution of higher learning at Nashville, Tenn., founded in 1874. The enrollment in all departments of the university in the collegiate year 1911-12 was 1541. There were 150 members of the faculty. There were no noteworthy changes in the faculty during the year and no important benefactions were received. The productive funds of the university amounted at the end of the collegiate year 1911-12 to \$636,036. There were 34,596 volumes in the library. President, Brown Ayres, Ph. D., LL. D.

TERRELL, ALEXANDER WATKINS. An American diplomat, died September 10, 1912. He was born in Patrick County, Va., in 1827, and was educated at the University of Missouri. In 1849 he was admitted to the bar and began practice in St. Joseph, Mo. He removed to Texas and was appointed judge of the district court in that State in 1857, serving until 1862. During the Civil War he was colonel of cavalry in the Confederate army. He was a member of the Texas House of Representatives for four years and of the senate for ten years. In 1893 he was appointed United States minister to Turkey. He held this position until 1897.

TERRELL, JOSEPH MERIWETHER. American public official, former governor of Georgia, died November 17, 1912. He was born in Greenville, Ga., in 1861, and was educated in the common schools. He studied law and was admitted to the bar in 1882. During 1884-1886 he was a member of the Georgia House of Representatives and in 1890-1892 was State senator. From 1892 to 1902 he was attorney-general of the State. He resigned this office in 1902 to accept the nomination for governor, to which office he was elected. He served two terms until 1907 and was succeeded by Hoke Smith. In 1910 he was appointed United

States Senator to fill the vacancy caused by the death of Senator Clay. A few months after his arrival in Washington he had a stroke of paralysis which eventually caused his death. Ill though he was he returned home and endeavored to have the legislature confirm his appointment to the Senate. The election, however, resulted in the choosing of a legislature which was opposed to him. Following this defeat he retired from politics and resumed the practice of law in Atlanta.

TERRESTRIAL MAGNETISM. See CARNegie INSTITUTION.

TERRY, DAVID BRAINERD. An American educator, died May 21, 1912. He was born in Worcester, Mass., in 1839, and graduated from Yale College in 1863. In 1871 he was a tutor at Yale and in 1872 was ordained to the Congregational ministry. In the following year he was appointed acting president and professor of Latin and Greek at Doane College, serving until 1881, when he was chosen president and professor of psychology. This position he retained until the time of his death.

TERRY, EDWARD O'CONNOR. An English actor, died April 1, 1912. He was born in London in 1844. He made his first appearance on the stage at the age of 19 in small local theatres. He later played in Douglas, Isle of Man, where in 1865 he was in the same company with Henry Irving. He made his first success at Manchester and shortly afterwards went to London. For seven years he took leading parts at the Strand Theatre, now demolished. He then went to the Gaiety, where he formed one of the famous quartette of actors including, besides himself, Royce, Nellie Farren, and Kate Vaughan. Here he remained six years playing burlesque parts. In 1887 he opened his own theatre in the Strand with *The Churchwarden*, and produced among other famous plays, *Sweet Lavender*, in which he played the leading part 670 times. He became one of the best known and most popular actors in England. Among the other well-known plays in which he took a prominent part were: *The Times*, and *In Chancery*, by Pinero. In addition to his activities in the theatre, he was a great traveler and a prominent Freemason. He wrote several farces and published several magazine articles.

TETANUS. The *Journal of the American Medical Association's* tenth annual summary of Fourth of July injuries showed a very gratifying reduction in the number of injuries and cases of tetanus compared with previous years. Only 7 cases of lockjaw were reported, as compared with 18 last year, and 17 in 1909. Six patients died in from 7 to 10 days after receiving the injury. All of the cases developed from blank-cartridge wounds. Besides the cases of lockjaw due directly to the use of fireworks, it is interesting to note also those occurring during the Fourth of July season which were due to penetrating wounds from other causes, such as nails or splinters, to crushing injuries, etc. Instead of a reduction in these cases this year there was an increase; 43 cases being reported during this Fourth of July season, or 14 more than last year, when 29 cases were reported. The fact that tetanus germs were apparently fully as prevalent if not more so this year than in 1911 makes the marked reduction of cases from Fourth of July injuries all the more significant. In addition

to the 6 deaths due to tetanus, 35 persons were killed by various forms of fireworks, making a total of 41 deaths, 16 less than last year, 90 less than 1910, and 174 less than in 1909. This is the lowest number of deaths from such causes during the ten years covered by *The Journal's* statistics. In 1912, 9 persons were killed outright by firearms, 7 by explosions of powder, bombs, or torpedoes, 2 by cannon, 2 by giant firecrackers, and 7 by various causes, as blood-poisoning, explosions of chemicals, etc. There were 8 victims also, mostly little girls, who were burned to death by fire from fireworks, some of these being the so-called harmless varieties, including very small firecrackers and sparklers.

The number of casualties shows a continuation of the remarkable decrease of the last few years, which unquestionably is the result of the efforts to secure more intelligent methods of celebration. This is evident from the fact that the most marked decreases are in the States in which the agitation for restrictive measures has been strongest. For example, the total casualties in Illinois this year are 39 as against 218 last year, 285 in 1910 and 546 in 1909; Massachusetts had 45 casualties this year as compared with 27 last year, 63 in 1910 and 430 in 1909; Ohio had only 55 casualties this year, as compared with 105 last year, 166 in 1910 and 323 in 1909; New York has 115 this year, as compared with 237 last year, 327 in 1910 and 897 in 1909; Wisconsin had only 38 this year, as compared with 52 last year, 171 in 1910 and 157 in 1909. Even in Pennsylvania, which has had the largest number of casualties for each of the last five years, there has been a marked improvement, clearly the result of a powerful campaign which has been carried on in that State, and particularly in Philadelphia, for more enlightened methods of celebration. That State has 265 casualties this year, as compared with 442 last year, 623 in 1910 and 986 in 1909. Altogether there were only 988 casualties this year, 615 less than last year, 1935 less than in 1910 and 4319 less than in 1909. There were 947 non-fatal injuries. Eight persons were totally blinded, 21 lost one eye each, 13 lost legs, arms and hands, and 43 lost one or more fingers. Although there has been a marked reduction in the total number of non-fatal injuries, the totals of these more severe injuries are about the same as reported for the two previous years. The giant firecracker continues to hold the first place as a cause of lacerated wounds and is responsible for most of the losses of eyes, hands and fingers. This year 362 injuries, including 2 deaths, were due to the giant firecracker. Firearms caused 157 accidents, including 9 killed. Of the total number thus injured nearly half were orderly persons who were struck by stray bullets from the reckless use of firearms by others, and 6 deaths resulted. The use of cannon caused 75 injuries, including 2 killed. In the ten years, a total of 40,117 people were killed or injured in the celebration of the Fourth of July.

Kocher has injected a solution of magnesium sulphate into the spinal canal in three cases of tetanus with success. He used Meltzer's technic except that a 15 per cent. instead of a 25 per cent. solution was employed; as high as 10 c. c. of fluid, corresponding to 0.03 per kilogram of body weight were injected. The greater susceptibility of children to the toxic

action of this drug must be borne in mind in treating a child; 2 c. c. would be the maximal dose for a child weighing 10 kilograms (about 22 pounds). Special care is taken in repeating the dose; an interval of twenty-four hours seems to be sufficient. If the dose is repeated sooner there is danger of cumulative action. After injection of 7 c. c. and five hours later of 10 c. c. of a 15 per cent. solution one patient reacted with deep sleep and stertorous respiration. Antitetanic serum may also be used, but the two methods should not be used together. Time must be allowed for the action of one drug to pass off before injecting the other.

TETANUS IN ANIMALS. See VETERINARY SCIENCE.

TEXAS. POPULATION. According to the Census Bureau statistics, compiled during 1912 out of the total population in the State in 1910, 3,896,542, the negroes numbered 690,059, and the mulattoes, 124,695. In 1890 the negroes numbered 488,171 and the mulattoes, 65,724. The foreign-born white population in 1910 was 240,001, compared with 177,581 in 1900. Of these, the larger proportion came from Mexico, 123,817; from Germany, 44,796; from Austria, 20,583; from Russia, 5805; from Italy, 7190, and from Ireland, 5360. Other countries in Europe are represented by smaller numbers.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1912 are given below:

		Acreage	Prod. Bu.	Value
Corn	1912	7,300,000	153,300,000	\$98,112,000
	1911	7,300,000	69,350,000	55,480,000
Wheat	1912	735,000	11,025,000	10,253,000
	1911	700,000	6,580,000	6,580,000
Oats	1912	865,000	31,140,000	12,350,000
	1911	787,000	18,499,000	9,959,000
Rye	1912	2,000	23,000	36,000
	1911	2,000	20,000	21,000
Rice	1912	265,600	9,429,000	8,863,000
	1911	238,300	8,174,000	6,539,000
Potatoes	1911	50,000	2,850,000	3,591,000
Hay	1912	387,000	a 542,000	5,637,000
	1911	606,000	a 606,000	7,211,000
Tobacco	1912	200	b 140,000	24,000
	1911	300	b 195,000	39,000
Cotton	1912	c 4,369,600
	1911	c 4,280,000

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The total production of the petroleum in 1911 was 9,526,474 barrels, compared with a total of 8,899,266 barrels in 1910. This increase is the first in the history of petroleum production in the State since 1905, when the production was 28,136,187 barrels.

The amount of coal mined in the State in 1911 was the greatest in the history of the industry. The total output was 1,974,393 long tons, valued at \$3,273,398, an increase over 1910 of 82,417 tons in quantity and \$112,323 in value. The State produced both bituminous and lignite coals. The increase in production was in bituminous coal. The increase is due chiefly to the growing population, and industrial development of the State, which consumes not only its own product, but also considerable quantities brought in from Arkansas, Oklahoma, Colorado, and New Mexico. Coal-mining in 1911 was free from labor troubles.

MANUFACTURES. The Thirteenth Census included statistics of manufactures in the State. These are for the calendar year 1909 and were compiled in 1912. The manufactures of the

State depend largely for their raw material upon the stock-raising, agricultural, and mineral products, and have been greatly stimulated in recent years by the rapid increase in the production of these materials. From the following table it will be seen that there were in 1909 4588 manufacturing establishments, which gave employment to an average of 84,575 persons.

	Number or Amount	P. C. of Inc. 1904-'09
1909	1904	
Number of establishments	4,588	3,158 45.3
Persons engaged in manufactures....	84,575	57,692 46.1
Proprietors and firm members...	4,496	3,073 46.3
Salaried employees	9,849	5,753 71.2
Wage earners (average number)...	70,230	49,066 43.1
Primary horsepower	282,471	164,637 71.6
Capital	\$216,876,000	\$115,665,000 87.5
Expenses	244,873,000	134,406,000 82.2
Services	48,775,000	30,587,000 59.5
Salaries	10,868,000	6,118,000 77.6
Wages	37,907,000	24,469,000 54.9
Materials	178,179,000	91,604,000 94.5
Miscellaneous	17,919,000	12,215,000 46.7
Value of products...	272,896,000	150,528,000 81.3
Value of products less cost of materials	94,717,000	58,924,000 60.7

The value of the product was largest in the industries connected with slaughtering and meat-packing, \$42,530,000; in flour and grist-mill products, \$32,485,000; lumber and timber products, \$32,201,000; oil, cottonseed, and cake products, \$29,916,000; industries connected with railways, \$13,359,000; printing and publishing, \$11,587,000. The total number of persons engaged in manufactures in the State in 1909 was 84,575, of whom 79,696 were male and 4879 female. Those under 16 years of age employed numbered 1256. The prevailing hours of labor for the majority of wage-earners averaged from 54 to 60 a week; 12 per cent. of the total being employed in establishments where less than 54 hours a week prevailed, and 21.8 per cent. in establishments where more than 60 a week prevailed. The largest number of wage-earners was in Houston, 5338; in Dallas, 4482; in San Antonio, 3105; in Fort Worth, 2059, and in Galveston, 1094. The value of the manufacturing industries in Dallas was \$26,958,664, and in Houston \$23,015,556.

EDUCATION. The total number of children of school age in the State in 1912 was 1,017,133. Of these, 684,248 were American white children and 204,237 were colored. There were 79,491 Mexican children of school age and 29,345 Germans.

FINANCE. The report of the State treasurer for the fiscal year ending August 31, 1912, showed a cash balance at the beginning of the fiscal year of \$413,124. The receipts for the year amounted to \$18,119,072 and the disbursements to \$17,973,122, leaving a balance on hand September 1, 1912, of \$793,417. The chief sources of revenue are from taxation and the chief expenditures are for education and the support of State institutions.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State include the State prisons, the Blind Asylum, the State Lunatic Asylum, the Orphans' Asylum, the Deaf and Dumb Asylum,

the North Texas Insane Asylum, the South-western Insane Asylum, and the State Epileptic Colony.

POLITICS AND GOVERNMENT

There was no meeting of the legislature in 1912 as the sessions are biennial and the last was held in 1911. The next session convened January 14, 1913. Elections for governor and other State officers were held during the year. The contest for delegates to the Republican National convention resulted in the most spirited struggles before the national committee and later before the national convention. This is discussed fully in the article **PRESIDENTIAL CAMPAIGN**, paragraph *Disputed Elections*. Precinct conventions were held in the State on May 4 for the election of delegates to the State convention. The Roosevelt forces won a majority. Governor Wilson received a majority of the Democratic votes, with Governor Harmon second. Primaries for the nomination of State officers were held on July 22. Governor Colquitt was renominated by a majority of about 40,000. His opponent for the nomination was Judge W. F. Ramsey. Congressman Morris Sheppard received the senatorial nomination to succeed Senator Bailey, who had announced his purpose to resign at the end of the present term. Mr. Sheppard made his campaign as an outspoken Prohibitionist and defeated Jacob F. Wolters, who opposed him on the anti-prohibition issue.

The election on November 5 resulted as follows: For President, Wilson received 221,435 votes, Taft 28,688, Roosevelt 26,740, Debs, 25,742, and Chafin 1738. Wilson's plurality was 192,767. For governor, Colquitt, Dem. received 233,013 votes, Johnson, Rep., 22,914, Lasater, Prog., 15,741, Andrews, Soc., 25,258, Houston, Pro., 2353, and Choate, Soc. Labor, 398. The legislature is Democratic by an overwhelming majority.

OTHER EVENTS. On February 22, a fire in the city of Houston did damage to the amount of \$5,000,000. The burned area covered 57 city blocks. Many factories were destroyed and St. Patrick's Roman Catholic Church was among the important edifices burned.

STATE GOVERNMENT. Governor, O. B. Colquitt; Lieutenant-Governor, William H. Mays; Secretary of State ; Attorney-General B. F. Looney; State Treasurer, J. M. Edwards; Comptroller, W. P. Lane; Superintendent of Public Instruction, F. M. Brally; Land Commissioner, J. T. Robinson; Commissioner of Agriculture, E. R. Kone—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Thomas J. Brown; Associate Justices, N. Phillips and W. E. Hawkins; Clerk, F. T. Connerly—all Democrats.

STATE LEGISLATURE, 1913. Democrats, Senate 30, House 108, joint ballot 138; Republicans, Senate 1, House 1, joint ballot 2. Democratic majority, Senate 29, House 107, joint ballot 136.

The representatives in Congress will be found in the article **UNITED STATES**, section *Congress*.

TEXAS, UNIVERSITY OF. A State institution for higher education at Austin, Tex., founded in 1883. The total enrollment in all departments of the university in the autumn of 1912 was 2250. The faculty numbered 130,

which does not include tutors and student assistants. There were no noteworthy changes in the faculty during the year and no important benefactions were received. The institution is supported almost entirely from State appropriations. The productive funds amounted at the end of the year 1911-12 to \$449,728. The library contained about 80,000 bound volumes and 27,500 pamphlets. President, Sidney E. Mezes, Ph. D.

TEXAS FEVER. See STOCK-RAISING AND MEAT PRODUCTION.

TEXTILE MANUFACTURING. During 1912 the manufacture of textiles proceeded vigorously, notwithstanding various conditions tending to disturb markets and prices. The year was not one of great profits for the manufacturers, but it was one of considerable activity, and except where harassed by strikes the various plants were in the most part operated to capacity, and where this was not the case it was often due to a lack of labor or disinclination on the part of local wage earners to avail themselves of employment. The price of cotton advanced soon after the beginning of the year and those manufacturers who had not purchased future cotton in the speculative markets were compelled to pay high prices for the raw material. The sales of cotton goods were large and the exports, both in value and yardage, were greater than in the two years immediately preceding, notwithstanding the fact that the business was conducted with smaller profits. The strike in the woolen and cotton mills at Lawrence, Mass. (see STRIKES), involved a bitter struggle and was followed by labor controversies at other manufacturing centres, which were settled by increased wages and concessions as to work, hours, etc. As manufacture was not efficiently conducted and controlled, a scarcity of goods developed during the year, notwithstanding the impending revision of the tariff. It was the general consensus of opinion of those working in the textile industries that the revision of the tariff on raw materials as well as on the finished products could be undertaken with advantage if it were done according to some consistent plan and with expert knowledge of the conditions involved. The newer manufactories in the United States were well equipped and organized, capable of handling a large volume of business, and in many cases the protection given in the Payne-Aldrich tariff law was considered unnecessary. The following official figures, compiled by the ways and means committee of the House of Representatives in regard to the various tariff schedules on textiles, are of interest as showing the general trend of the discussion and the basis on which the majority of the committee was working at the close of 1912:

Tariff schedule and description	Estimated consumption (000 omitted)	Consumers' tax Revenue (000 omitted)	Protection (000 omitted)
I-Cotton manufactures	\$ 1,408,000	\$ 12,325	\$ 210,251
J-Flax, hemp, etc.	373,000	47,053	23,578
K-Wool	1,442,000	28,982	323,328
L-Silk	273,000	16,053	54,653
All others	16,873,000	196,168	1,294,620
Total	\$20,369,000	\$309,581	\$1,916,428

The amount of estimated protection was based on the assumption that the goods con-

sumed in the United States were raised in price above what they would have been under free trade equal in percentage to the foreign tax.

MILL CONSTRUCTION, 1912. The annual report of new textile mill construction for 1912, compiled by the *Textile World Record* of Boston, stated that 265 new textile mills of various kinds were built in the United States during the year, this number being almost exactly equal to the annual average (269) for the preceding ten years. This was considered to indicate a healthy development of the industry and a gratifying freedom from depression or an equally undesirable boom. Equally satisfactory was the report of enlargements and improvements, showing that manufacturers had been active in strengthening their plants by extensions and improvements.

COMPARISON OF NEW MILL CONSTRUCTION FOR FIVE YEARS

	1912	1911	1910	1909	1908
Cotton	37	32	67	80	47
Woolen	24	20	31	47	23
Knitting	122	92	113	105	94
Silk	46	38	34	37	33
Miscellaneous	36	26	29	20	25
Total	265	208	274	289	222

As regards new cotton mills, the Southern States led, with 21 of the total of 37 mills, 437,000 spindles out of a total of 533,000 installed in new mills, and 6650 looms out of a total of 9774, making 1912 about an average year. The Carolinas, with 293,000 spindles, represented two-thirds of the southern total and 55 per cent. of the total number of new spindles for the United States. New England had 94,400 of the new spindles, showing a decided slackening in the development of the cotton industry in the older manufacturing section. The decrease in new mill construction in the leading manufacturing centres means a wider distribution of the industry throughout the United States, a condition that brings with it many advantages.

NEW COTTON MILLS, 1912

New England States:	No.	Spindles	Looms
Maine	1	75,000	2,000
Massachusetts	5	4,400	700
Rhode Island	4	15,000	358
Southern States:			
Alabama	1	35,000	900
Georgia	1	14,000	300
North Carolina	10	153,000	2,000
South Carolina	5	140,000	3,250
Tennessee	2	10,000
Texas	1	10,000	200
Virginia	1	75,000
Middle States:			
New Jersey	1
Pennsylvania	5	1,700	66
Total	37	533,000	9,774

COMPARISON OF SPINDLES IN NEW COTTON MILLS FOR THREE YEARS

	1912	1911	1910
New England	94,400	170,500	463,714
Southern States	437,000	172,000	214,028
Middle and Western	1,700	4,920	12,500
Totals	533,100	347,420	695,242

In the knitting industry just one-half of the 112 new mills were built in Pennsylvania, the Middle States accounting for 82, or about three-quarters of the total for the entire country. In 1911 the new construction was 113 mills, as compared with 104 in 1910 and 92 in 1909.

NEW KNITTING MILLS

New England:	1912	Western States:	1912
Connecticut	1	Michigan	3
Maine	3	Minnesota	2
Massachusetts	7	North Dakota.....	1

In woolen and worsted manufacturing there were constructed 23 new mills, as compared with an annual average of 35 for the preceding eight years. Among the 23 for 1912 there were six small plants with worsted and woolen spinning machinery, the others being weaving mills or equipped for felts, wadding, and other wool goods.

NEW WOOLEN AND WORSTED MILLS, 1912

The production of woolens and worsteds was stated to be the largest on record in the United States, in spite of the fact that here impending changes in the tariff were concerned, as the wool schedule figured preëminently in the discussions. (See *TARIFF*.) The strikes in the spring and the increased value of raw materials also contributed to the higher prices for the finished products, which continued, nevertheless, in good demand. Notwithstanding the

limited yardage required for women's dresses, there was a compensating demand for materials for cloaks and suits, while in cloths for men's clothing business was particularly active during the year. The use of domestic materials was constantly increasing and the importation of women's dress goods and cloths was considerably less than in 1912. New plants were being built in the United States, especially in Passaic, N. J., and vicinity. Here a group of worsted and woolen mills, founded by German capital and managed by German manufacturers, had grown up, and these, along with other mills built by English and French capital and managed by foreign experts in other parts of the United States, were becoming important features of the industry. It was admitted that the cost of building and equipping such plants was greater than in Europe, and also that the cost of raw materials was higher, but with a proper adjustment of duties and other conditions it was believed that the foothold gained by such industries would be maintained and business extended.

THALASSOTHERAPY. Mace and Quinton continued their reports on the treatment of infantile gastro-enteritis by subcutaneous injection of "marine plasma," as they call the sterilized sea-water they use for the purpose. Milk feeding is begun immediately and continued during the treatment; the children are transformed by the injection so that they are able to take care of milk. The amounts of sea-water to be injected vary with the nature of the trouble. With enteritis causing constipation, they inject from 10 to 30 c. c. twice a week, feeding the child with from one-eighth to one-sixth of its weight. With athrepsia and ordinary diarrhea, they inject from 30 to 100 c. c. two or three times a week, and feed from one-seventh to one-fifth of the weight. Photographs show the recovery of almost moribund children under this regimen. In 1905 a series of experiments was made, including 2592 days of tests, to determine the superiority of sea-water over ordinary salt solution for these injections in infants. It was found that infants increased in weight twice as fast under sea-water, and this increase was not due to the weight of the sea-water, being out of proportion to the amount of sea-water ingested. In severe cases 200 or 300 c. c. of sea-water is injected night and morning. From the start the child is given from six to eight bottles of milk a day, each representing 100 gm. of milk, to which 20 gm. of water have been added. A bottle of pure water between the feedings completes the treatment, as much water being given as the child will drink. This is kept up for a week and then one injection a day is sufficient. The sea-water almost invariably restores the digestive capacity in less than two hours so that the infant stretches out its hands for the bottle it previously rejected.

THROMBOKINASE. The idea that the tissue juices might furnish a body which would

hasten clotting, and that this might be of more service than fresh blood serum in the control of hemorrhage, led Strong to prepare, following the method of Batelli, an extract of sheep's lungs after the following technic: Sheep's lungs are taken direct into sterile towels, and the larger bronchi are removed to avoid as many bacteria as possible. The lungs are then ground in a meat grinder and soaked in twice their volume of sterile water for an hour; 1.5 c. c. glacial acetic acid for every liter of extract is then added, drop by drop, with constant stirring. A white flocculent precipitate results, which is immediately collected by centrifuging. The free acetic acid is removed by washing thoroughly with salt solution. The centrifuge tubes are then filled with alcohol and the mixture is again centrifuged thoroughly, when the alcohol may be decanted and the nearly dry precipitate may be spread on crystallizing dishes and rapidly evaporated at a low temperature in vacuo. Dryness will be secured within twelve hours. The resultant brownish powder is scraped off and sealed in sterile tubes. Several preliminary tests showed that rabbit's blood, in test tubes containing a few flakes of the powder, clotted more rapidly than blood alone, and that the powder contains a body which in the moist state is inactivated at 70° C. for thirty minutes. It is this evidence of a ferment body which leads to the use of the term thrombokinase for the powder. Similar preparations were made from spleen, liver, bone marrow, endocardium and aorta. Experimentally, these did not work as well as preparations from the lungs. The powder is said to have been used clinically with success by many operators in nose and throat work.

TIBET. A central Asian Chinese dependency. Area, 756,000 square miles; population, estimated, 2,000,000. Capital, Lhasa, with an estimated population of from fifteen to twenty thousand. Many Buddhist monks are included among the inhabitants, the city being the home of Buddhism. Two Chinese ambans, previous to the outbreak of the Chinese revolution, administered the country; but the non-Chinese tribes subsequently declared their independence, and during the ensuing mutiny the ambans abdicated. The Dalai Lama, who has spent the last few years fleeing to India and returning thence, made his way back in June, 1912, after an absence of about a year. The Chinese garrison having received orders from Peking in October not to vacate the capital, their general was imprisoned in the Tenyeling monastery.

TILLINGHAST, MARY ELIZABETH. An American artist, died December, 1912. She was born in New York City and studied in Paris under Carolus Duran and Henner, studying also in New York under John La Farge. Her work was almost entirely in stained glass. She was awarded a gold medal at the Chicago Exposition in 1893 and a gold medal at the Cotton States Exposition in 1895. Among her best known works are mosaic glass windows in the Home of the Friendless, for Mrs. Russell Sage, in honor of Miss Helen Gould; an astronomical and classic window in the New Allegheny Observatory; "Revocation of the Edict of Nantes" in a window of the New York His-

torical Society Building, and mural decorations in the café of the Savoy Hotel, New York City. She also executed memorial windows in churches in Terre Haute, Ind., and Washington, D. C.

TIME, STANDARD. The twenty-four hour system of time notation was adopted for the French army in an order to the chief of the general staff to obviate the use in military correspondence and reports of A. M. and P. M. This system has been adopted by the French railways, post office, and telegraph systems, which are allied to the military service and in the interests of harmony and convenience. Under the new system 11:30 P. M. will be 23:30.

RADIOTELEGRAPHIC TIME SIGNALS. An International Time Signal Conference was held at Paris on the invitation of the French government, October 15 to 23, to organize a radiotelegraphic time signal service to cover the entire globe so that even the most remote points might receive at least two signals every 24 hours. These signals were being transmitted from the Eiffel Tower, Paris; Halifax, Nova Scotia; Norddeich, North Germany, and Washington. The extent of the time service proposed may be appreciated from the fact that Africa was to have stations at Massauah in Erythrea, Mogadiscio in Somaliland, and Timbuctoo, while in America there would be a station at San Francisco, in South America at San Fernando in Brazil, and on the Pacific at Honolulu, Samoa, Guam, and Manila. The signals were to be sent out from the great national observatories near the principal stations and the control of the service was to be under an international bureau at Paris. Official support was to be furnished by 16 states taking part in the conference and the service was to begin in July, 1913. Storm and weather signals were also to be transmitted and the plan was considered to promise great assistance to mariners, as it would enable them daily to correct their chronometers and would increase the accuracy of their observations for position. Many interesting developments of the scheme were anticipated.

TIMOR. An island (the largest) of the Lesser Sunda group, divided between the Netherlands and Portugal. Area (estimated), 12,593 square miles, of which 7330 belong to Portugal; population, 400,000, of whom 200,000 are Portuguese subjects. Capital of the Portuguese portion, Dilli.

TINEL, EDGAR. A Belgian composer and director, died October 28, 1912. He was born in Sinay, Belgium, in 1854, and received his musical education at the Brussels Conservatory. He won the Prix de Rome for a cantata. In 1889 he was made inspector of music in the state schools and in 1896 succeeded Kufferath as professor of counterpoint at the Brussels University. His oratorio, *Franciscus*, won for him a reputation outside of his own country and attracted so much attention that it was produced at the Cardiff Festival in 1895. In 1909 he was appointed director of the Royal Conservatory of Music at Brussels. He was the author of a book on Gregorian chants, and among his compositions in addition to those mentioned are: The opera *Godoleva*; *Katharina*, a sacred opera; and several works for chorus and orchestra.

TISSUES, PRESERVATION OF. See SURGERY.

TITANIC, LOSS OF THE. The Royal Mail steamship *Titanic* of the White Star Line, sailing on her maiden voyage from Southampton to New York, with 2223 passengers and crew, was lost at sea by collision with an iceberg on the night of Sunday, April 14, 1912, and 832 passengers and 685 of the crew perished, the remainder being rescued from lifeboats by the Cunard steamship *Carpathia*. The *Titanic* was the largest vessel in the world at the time of the disaster. She was built for the White Star Line at Belfast, Ireland, by Harland and Wolff for service between Southampton and New York, being a sister ship of the *Olympic* of the same line, and costing about \$7,500,000. The keel was laid on March 31, 1909; she was launched on May 31, 1911, and on March 31, 1912, at Belfast, she was inspected and passed by the officials of the British Board of Trade.

The registered dimensions of the *Titanic* were as follows: Length, 852.5 feet; beam, 92.5 feet; depth from top of keel to the lowest point of the highest deck extending continuously from bow to stern, 73 feet, 3 inches; displacement, at 34 feet, 7 inches, 52,310 tons; gross tonnage, 46,328; net registered tons, 21,831. She was a three-screw vessel with Parsons low-pressure turbines for the centre propeller, and reciprocating engines for the wing propellers, some 50,000 or more horsepower being developed, which was sufficient to drive the vessel at a speed of 21 knots an hour. There were 29 boilers and 159 furnaces. There were seven principal steel decks and a cellular double bottom $5\frac{1}{4}$ feet deep between the inner and outer skins. The vessel was divided by 15 transverse water-tight bulkheads into 16 compartments reaching well above the water line. There were, however, no longitudinal bulkheads, nor were there coal bunkers along the side so cut off as to serve a similar function in case of exterior injury. In fact, the arrangement of the bottom plating did not conform so closely to warship design as did that of the *Mauretania* and other ships built under Admiralty specifications with the idea of possible use as cruisers in the naval service, where the danger of torpedo attack had to be considered. That these were real defects may be judged from the fact that the *Olympic*, the sister ship of the *Titanic*, was withdrawn from service to be changed by the introduction of an inner skin throughout the ship well above the water line, this skin being three feet within the outside hull of the ship and in a portion of it it was proposed to store fuel oil for the boilers. A larger ship under construction was considerably modified in its plans to secure similar advantages.

The *Titanic* was provided with 14 wooden lifeboats, each 35 feet long and capable of holding 65 persons; two wooden cutters 25 feet long, constructed to carry 40 people each, and 4 Engelhardt collapsible life-rafts with a capacity of 47 persons each. There were 3560 life-belts in cabins and berths. The crew numbered 899, of whom 494, including 23 women, were stewards, cooks, etc.; 70 were in the deck or navigating department, 327 were engineers, oilers, stokers, etc., in the engineering department, and 8 formed the band.

The fateful voyage was begun on April 10, 1912, the *Titanic* leaving Southampton shortly after noon in command of Captain E. J. Smith,

an experienced and careful officer. She proceeded to Cherbourg, where passengers and mails were taken aboard and the voyage resumed to Queenstown, leaving that port about 1:30 P. M. on Thursday. Steady progress was made until Sunday night, when, at 11:40, ship's time, most of the passengers having retired, an almost imperceptible shock occurred and the engines were stopped. The *Titanic* had struck an iceberg obliquely on the starboard side. The ice had been seen by the lookout at the crow's nest, who gave the usual signal and telephoned the officer of the watch; but despite the fact that the helm was put hard to starboard and the engines were reversed, it was too late, for the ship was moving at a speed of over 20 knots, or 300 feet in less than 10 seconds. So early as 5 o'clock the *Titanic* had been warned by wireless of the presence of icebergs in her track, and an active lookout had been maintained without slackening speed. The ship, moving with high velocity, struck the iceberg, whose jagged points below the water pierced the plating on the starboard side at the bilge, or about 10 feet above the level of the keel, and broke and ripped away the plates form about the forepeak aft, the damage extending a distance of some 300 feet. Six compartments were immediately opened to the sea and in these the water rose steadily, driving the stokers out. The shock was sufficient to bring Captain Smith to the bridge, and the seriousness of the situation was soon realized. At about 12:05 orders were given to uncover the lifeboats and about a quarter of an hour later came the order to swing out the boats. In the meantime the position of the ship, $41^{\circ} 46'$ N. lat. and $50^{\circ} 14'$ W. long., had been worked out and given to the wireless operator, with orders to send out the international distress signal. At about 12:30 came the order, "All passengers on deck with life-belts on," and the hastily clad and assembled passengers were grouped while the boats were prepared for loading and lowering. The women and children were separated from the men, but the chance distribution of passengers enabled some of the latter to be saved simply by their being in proximity to boats whose capacity was not reached. From 12:45 to 2:05 the 16 lifeboats and two of the collapsible boats were launched successfully, the remaining two collapsible boats floating off as the ship sank at 2:20. The main promenade deck was under water when the last boat left the davits. The vessel seemed to go down by the stem and finally to sink in an almost vertical position, with propellers out of water. The lights burned until the submergence of the dynamo room, and the band played on the deck as the ship went down. Captain Smith and all of the engineer staff perished at their posts, but a few of the ship's officers who clung to wreckage were subsequently picked up. In addition to the wireless, which was kept constantly in operation, signals of distress were fired and these, subsequent investigation seemed to show, were seen by the steamship *Californian* from a distance of about 10 miles, but were unheeded.

To the *Carpathia*, on her way from New York to Gibraltar and Genoa, with 720 passengers and a crew of 325, fell the lot of picking up the survivors in the boats. This Cunard vessel received the *Titanic's* wireless call for

assistance at 12:35 A. M., while 56 miles away and steaming at a speed of 14 knots, and Captain Arthur Henry Rostron, who later received a medal and the thanks of Congress for his part in the rescue, immediately put his ship about, increased his speed to 17½ knots, and made every preparation for picking up and relieving the survivors. Soon the *Titanic's* boats were sighted and were taken aboard, the rescued being made comfortable, and after it was found that there was no hope of saving others the *Carpathia* turned back to New York. During the voyage the sad story was sent by wireless to a horror-stricken world. Sympathy was poured out unsparringly, vast benefit funds were raised for the survivors and the families of the lost, and the thrill of horror became universal as various sensational features of the disaster were revealed.

There developed a bitter spirit against the company, due to the alleged withholding of news and the dissemination of incorrect information, the saving of the managing director and an abnormal proportion of the crew, the lack of lifeboats, and the running at full speed after warnings of ice had been received, while the wireless telegraph interests also were criticised for various shortcomings, actual and alleged.

In pursuance of a resolution of the United States Senate dated April 18, 1912, a subcommittee of the committee of commerce, consisting of Senators William Alden Smith of Michigan (chairman), Bourne of Oregon, Burton of Ohio, Fletcher of Florida, Simmons of North Carolina, and Newlands of Nevada, was appointed to investigate the causes leading to the wreck of the White Star liner *Titanic* and to recommend suitable legislation. This committee proceeded with energy and vigor to uncover every possible detail connected with the sinking of the *Titanic*. Hearings were begun in New York on April 18, the day after the arrival of the *Carpathia*, so as to prevent any essential witnesses leaving the United States, and the sessions were then resumed in Washington. The investigation occasioned unfavorable comment at home, and this was reëchoed in the foreign press. The committee suffered from not being composed of technical men, and, largely as a result of the treatment of the investigation by the lay press, an unfortunate and unwarranted presentation of its work was spread abroad. Actually the investigation was of prime importance by reason of its promptness and minute consideration of the circumstances when recent. As was stated by an English critic, the Senate investigation was essentially democratic and represented the viewpoint of the average man rather than the naval architect, the ship-owner, and the Board of Trade, who, in fact, were virtually on trial at the bar of public opinion. Having taken some 1100 pages of testimony, the committee proceeded to consider and then presented its conclusions in a report (62d Congress, 2d Session; Report No. 806) submitted by Senator Smith on May 28, 1912.

The committee recommended that no vessel should be licensed to carry passengers from the ports of the United States until all regulations and laws of the United States had been fully complied with, and that lifeboat accommodations for every passenger should be required, as well as lifeboat drills, assignment

of passengers to definite boats, and like provisions. Electric searchlights for vessels carrying more than 100 passengers were recommended and various reforms in the provision and installation of wireless telegraphy, including the keeping of an operator constantly on duty both day and night. Structural improvements, including a water-tight skin inboard of the outside plating well above the water line, either in the form of an inner bottom or of longitudinal water-tight bulkheads from the forward collision bulkheads over not less than two-thirds of the length of the ship, were recommended, while higher and stronger transverse bulkheads and a water-tight continuous structural deck were deemed essential. Suitable bills embodying the more important of the committee's recommendations were introduced into Congress and referred to the appropriate committees. See SAFETY AT SEA.

The British Court of Inquiry, appointed by the ministry under the authority and direction of the Board of Trade, was organized with care as to its judicial functions and procedure and as to the technical qualifications of its members. It consisted of Lord Mersey, as wreck commissioner, and the following assessors: Rear-Admiral the Hon. S. A. Gough-Calthorpe, R. N.; Captain A. W. Clarke; Commander F. C. A. Lyon, R. N. R.; Professor J. H. Biles, D. Sc., LL. D.; and Mr. E. C. Chaston, R. N. R., with Sir Rufus Isaacs, the attorney-general, in attendance in behalf of the government. The testimony of various survivors was taken at great length and elaborate evidence and opinions from naval men, marine architects, builders, designers, and others professionally qualified, were heard, those concerned, including labor interests, being represented by counsel. The conclusions of the court were important, but were definite in but few respects and indicated that most of the problems need further consideration from special committees or the Board of Trade. The loss of the ship was attributed not to lack of discipline but to high speed and insufficient lookout. The most important recommendations were that the newly appointed bulkhead committee of the Board of Trade investigate the practicability of providing ships with double skins, longitudinal bulkheads, or other water-tight subdivisions, and that lifeboat accommodations should be provided for everyone on board.

One immediate effect of the disaster was the decision of the transatlantic lines by mutual agreement to move their routes some 60 or 70 miles further south in the vicinity where icebergs had been encountered. This action, taken on April 16, was followed by an agreement between the companies and the United States Hydrographic Office, made on April 19, to move the routes about 100 miles further south of the former established courses, thus making them about 175 miles longer. It was further provided that a United States warship or revenue cutter should cruise in the neighborhood of the ice and give warning by wireless of the proximity of 'bergs and ice floes.

This great disaster must be considered with due regard for the fact that it was as unique as it was appalling. Previously, but two cases in all transatlantic travel were on record where a passenger steamship had collided with an iceberg, and one of these, the *Arizona*,

Copyright, Underwood and Underwood, N. Y.
STEAMSHIP "TITANIC" LEAVING SOUTHAMPTON ON HER ILL-FATED TRIP TO AMERICA

reached port in safety. Nor has increase in speed increased the risk of the traveler at sea. According to statistics presented by Sir Alfred Chalmers, late adviser to the Board of Trade, in the decade 1892-1901 three and a quarter millions of passengers made the transatlantic trip, and of these, 73 perished as the result of accidents in British ships. In the ten years 1902-1911 the number of travelers had risen to six million and the loss of life in British ships had fallen to nine. In American vessels the proportion of casualties has been one death to 800,000 passengers carried. Therefore, any conclusions from this great disaster can be drawn only after considering the abnormal conditions prevailing, which might not be repeated for centuries, and this was most apparent in the recommendations of the two national commissions charged with the investigation of the matter. Popular criticism and comment, while abundant, were far from pertinent or constructive. In England more than in the United States the calamity formed the subject of serious essays and articles from noted men of letters and students of affairs as well as naval men. Two interesting volumes were published dealing with the disaster: *The Loss of the Titanic*, by Lawrence Beesly, one of the survivors, and *An Unsinkable Titanic*, by J. Bernard Walker, editor of the *Scientific American*, in which the various structural and engineering questions connected with the wreck are discussed. That the disaster would have a most healthy effect on transatlantic navigation was evident very early, for the lines of their own volition instituted a number of reforms, but the number of radical innovations necessary or desirable were comparatively few.

TOBACCO. The tobacco crop of the United States in 1912 was 962,855,000 pounds, which was 7 per cent. above the average of the preceding five years. The average price was the highest in many years, making the total value of the crop \$104,063,000, which is the largest on record. The production and value of the crop by types and districts were as follows:

Cigar Type	Acreage	Prod. 1000	Value 1000
New England 1	23,500	39,950	9,589
New York 2	4,000	5,200	655
Pennsylvania 3	44,200	64,090	5,448
Ohio—Miami Valley 4	54,000	53,460	4,277
Wisconsin 5	42,200	54,438	5,958
Georgia and Florida 6	4,500	3,766	1,130
Chewing, Smoking, Snuff, and Export Types			
Burley 7	228,000	196,080	21,569
Kentucky and Tennessee			
Dark 8	384,000	268,040	18,686
Virginia sun cured 9	15,000	9,750	780
Virginia dark 10	75,000	49,500	3,861
Bright yellow (Va., N. C., and S. C.) 11	310,000	187,540	29,202
Maryland and Eastern Ohio export 12	31,000	22,010	1,783
Perique (La.) 13	500	150	45
Scatterings	9,900	8,881	1,050

Price paid farmers, in cents: 1 24; 2 12.6; 3 8.5; 4 8; 5 11; 6 30; 7 11; 8 6.2-7.8; 9 8; 10 7.8; 11 15.2-16.1; 12 8.1; 13 30.

The small yields of tobacco in some of the export and manufacturing tobacco districts have been demonstrated to be due to the continued growing of clean-cultured humus-depleting crops

on the tobacco lands, with little or no attention to soil-improving crops. Rotations for tobacco are being advocated. The growing of winter cover crops has been shown to be highly beneficial to tobacco.

The report of the commissioner of internal revenue for the year ending June 30, 1912, shows that tax was collected on 7,256,390,303 cigars (an increase of nearly four and a half million over 1911), 1,093,728,800 little cigars (a decrease of 10 per cent.), 11,239,535,803 cigarettes (a gain of 15 per cent.), 30,079,482 pounds of snuff (a gain of 7 per cent.), and 393,785,146 pounds of smoking and chewing tobacco. The manufacture of cigarettes was the largest on record. The total revenue collected on all lines of tobacco manufactures was the largest ever received, amounting to \$70,590,151.60, an increase over the previous fiscal year of \$3,584,201.04, or 5.35 per cent. In the 50 years in which revenue has been collected on tobacco and its manufactures these taxes have aggregated the colossal sum of \$1,853,699,379.79. In 1911 the United States imported 48,203,288 pounds of tobacco, mainly filler and other leaf, valued at \$27,865,565. It exported in that year 255,327,072 pounds, but the price was much lower than that of the imported, its total value amounting to \$39,255,320.

As a result of the charge that five foreign governments have taken steps to discriminate against American tobacco, a commission was provided by Congress to investigate the conditions surrounding the sale of American-grown tobacco to foreign markets. A bill has been introduced in Congress greatly increasing the taxes on tobacco and bringing them up to the rates of 1879, the increase being justified by its proposed use for building great trunk lines of highways to connect the capitals of the several States with the national capital. This, it is estimated, could be done in a period of five years.

A treatise on the *Import and Manufacturing Tobaccos of the United States, with Brief References to the Cigar Types*, by E. W. Mathewson, was published by the Department of Agriculture during the year.

TOBACCO TRUST. See TRUSTS.

TOGO. A German West African protectorate between Dahomey and the Gold Coast. Estimated area, 87,200 square kilometers (33,668 sq. miles). Estimated population, 1,000,000; whites (January 1, 1911), 363, of whom 327 German. Lome is the seat of government and chief port. Imports and exports in 1909, 11,235,000 and 7,372,000 marks; in 1910, 11,466,000 and 7,222,000. Imports from Germany in 1909 and 1910, 6,678,000 and 6,298,000 marks; exports thereto, 4,532,000 and 4,526,000. Chief exports in the two years: Palm kernels, 1635 and 2034 thousand marks; silver coin, 1545 and 1401; palm oil, 912 and 1233; rubber, 969 and 1147; cotton, 417 and 456; corn, 979 and 290. Tonnage entered (1910), 576,639. Railways in operation at the end of 1911: Lome-Anecho (Little Popo), 44 kilometers; Lome-Palime, 119; Lome-Atakpame, 160; total, 323 kms. (201 miles). The budget for 1911-12 balanced at 3,343,700 marks (including 127,500 marks loan); for 1912-13 at 3,175,510 (24,900 loan). Governor (1912), Duke Adolf Friedrich of Mecklenburg-Schwerin.

TOLL-RATES. See PANAMA CANAL.

TOMATO SEED OIL. See HORTICULTURE, and CHEMISTRY, INDUSTRIAL.

TONGA (or FRIENDLY) ISLANDS. A British protectorate; a group of islands (390 sq. miles, 21,695 inhabitants in 1910) in the southern Pacific. Most of the islands are of coral formation; some contain active volcanoes. Tongatabu contains the capital, Nukualofa. Imports (1910), £160,543; exports, £245,946; revenue (1910-11), £33,600; expenditure, £42,852. There is a native king (Jioaji Tubou II.), and a British agent and consul (in 1912, W. Telfer Campbell).

TONGKING. The northernmost division of the French colony of Indo-China (q. v.). Hanoi (103,238 inhabitants) is the capital, and the capital of French Indo-China. Rice is the chief crop cultivated; sugar-cane, cotton, cardamoms, etc., are also raised. There are cotton, silk, and sugar mills.

TORONTO, ONTARIO. See MUNICIPAL OWNERSHIP.

TORONTO, UNIVERSITY OF. An institution for higher education, founded in 1827 as Kings' College, at Toronto, Canada. The enrollment in the various departments of the university in the autumn of 1912 was 4136, divided as follows: Arts, 2352; medicine, 519; applied science, 793; household science, 134; education, 305; forestry, 33. The faculty numbered 430. Dr. F. J. W. Ross, professor of gynecology, died during the year, and Dr. B. P. Watson of Edinburgh, Scotland, was appointed his successor. Professor Ramsay Wright, professor of biology, and Professor Henry Montgomery, museum curator, retired. Dr. G. A. Guess was appointed professor of metallurgy. Among the important gifts during the year was the sum of \$10,000 for the establishment of the James H. Richardson research fellowship in anatomy. The George N. Peters scholarship was established with a fund of \$2500. The valuation of the assets of the university, including lands, building, and equipment on June 30, 1912, was \$5,568,537. The income in the collegiate year 1911-12 was \$863,556. The library contained 127,317 bound volumes and 39,392 pamphlets.

TORRES STRAITS, PEOPLE OF. See ANTHROPOLOGY.

TORREY, BRADFORD. An American naturalist and writer, died October 6, 1912. He was born at Weymouth, Mass., in 1843, and was educated in the public schools of that town. He engaged in literary and journalistic work for the greater part of his life. From 1886 to 1901 he was an editor of *Youth's Companion*. Most of his writings deal with natural history. Among them are, *Birds in the Bush* (1885); *A Rambler's Lease* (1889); *The Foot-Path Way* (1892); *A Florida Sketch-Book* (1894); *Spring Notes from Tennessee* (1896); *Every-Day Birds* (1900); *The Clerk of the Woods* (1903); *Nature's Invitation* (1904), and *Friends on the Shelf* (1906). He edited Thoreau's *Journal*.

TORREY, FRANKLIN. An American sculptor, died November 17, 1912. He was born in 1829. Early in his youth he went to Italy and studied sculpture and he remained in that country practically for the remainder of his life. He became the owner of the Carrara Marble Works in Florence and was for a time United States consul at Genoa. The American Church

at Florence was built largely by his munificence. Some of his works in sculpture are in the United States.

TRADE UNIONS. The year 1912 was of special interest in the trade union movement primarily because of the radical character of many union activities in various countries. In the United States, syndicalism (q. v.), represented in the Industrial Workers of the World (q. v.), appeared for the first time in the eastern manufacturing section; in England also the syndicalistic agitators were especially active. (See STRIKES AND LOCKOUTS.) In general trade unions in the United States showed a greater tendency toward political action and those of Great Britain became more decidedly Socialistic; while on the Continent, particularly in France, Radical movements gained in power.

UNITED STATES. The principal trade union organization in this country is the American Federation of Labor (see LABOR, AMERICAN FEDERATION OF). This was an off-shoot from the Knights of Labor, an industrially organized body. The Knights of Labor still exist, but with a relatively small membership. Other national unions not affiliated with the American Federation of Labor include the following: American Flint Glass Workers Union; Bricklayers and Masons International; Brotherhood of Locomotive Engineers; Brotherhood of Locomotive Firemen and Enginemen; Brotherhood of Railroad Trainmen; and the Order of Railway Conductors. Other important features of the trade union history in the United States were the progress of the boycott case against the Hatters' Union, described under BOYCOTT, and the criminal suits described below.

DYNAMITERS. The destruction of the *Los Angeles Times* building, involving the slaughter of 21 persons in October, 1910, proved to be only one of about a hundred dynamitings by members of the International Association of Bridge and Structural Iron Workers. These hundred cases of destruction were a part of the warfare which this union was carrying on against employers who refused to accede to the demands for a closed shop. This warfare began with a strike in 1905 and had not been terminated at the close of 1912. The first dynamiting case occurred in 1906. In May, 1911, J. J. McNamara, secretary of the Iron Workers, and his brother, J. B. McNamara, were arrested. They pleaded guilty. (For details of this celebrated case, see preceding YEAR BOOK.) Meanwhile the federal government and the National Erectors' Association, composed of employers, had employed numerous detectives on the case under the direction of William J. Burns. Grand jury proceedings were begun at Indianapolis early in the year, evidence regarding about 113 dynamitings of bridge, viaduct, and building construction work in various parts of the country being presented. On January 17, Ortey McManigal, who had been employed with J. B. McNamara under the direction of J. J. McNamara to do dynamitings, gave to the jury the details of his activities. Early in February, 54 labor leaders were arrested, 32 of them simultaneously in widely separated parts of the country following tele-

graphic signals. Much difficulty was met in securing talesmen for the jury to try the accused iron workers, but the trial was begun October 1. Meanwhile 7 defendants were discharged; McManigal pleaded guilty, as did Edward Clark, leaving 45 defendants for trial. Four of these were discharged on December 2. The momentous character of the case was shown by the employment of more than a dozen attorneys, including Senator Kern of Indiana, by the defense. The evidence showed that the executive board of the Iron Workers' Union had granted McNamara \$1000 per month, which he was allowed to expend without rendering any account. Letters written by various officers indicated that a "dynamiting crew" was employed as a regular part of the campaign against open-shop employers. It was on these facts that the government showed all the indicated officials to be linked together in guilt. The most important witness for the government was McManigal, who detailed 21 explosions which he personally caused. Altogether 549 witnesses were examined, their testimony covering 25,000 pages. These witnesses were brought from all parts of the country, one from Hawaii and one from Panama; they included mechanics, engineers, railway station check-boys, hotel clerks, detectives, stenographers, contractors, and telephone operators. Although the technical charge against the defendants was illegal transportation of explosives, all other evidence relative to the destruction of property by dynamite and nitro-glycerine was allowed as showing the motives for transportation. In his testimony McManigal declared that he was induced to perform his first dynamiting job in 1907 by Herbert S. Hockin, former secretary of the Iron Workers' Union. For this he received \$75. He declared that the McNamaras had planned to blow up the Panama Canal locks, the Frick Building in Pittsburgh, the Los Angeles aqueduct, and also a sleeping car in which was a woman stenographer formerly employed by them who knew of the dynamite plots and whose testimony might be used against them. On December 27, after more than 30 hours deliberation, the jury returned a verdict of guilty in the case of 38 of the defendants. Frank M. Ryan, president of the Iron Workers' Union, was sentenced on December 30 to 7 years' imprisonment; John T. Butler, vice-president, to 6 years; Herbert S. Hockin, former secretary, to 6 years; Olaf A. Tvetmoe, of San Francisco, to 6 years; Eugene A. Clancy, of San Francisco, secretary of the California building-trades council; Philip A. Cooley, of New Orleans; Michael J. Young of Boston; J. E. Munsey, of Salt Lake City, and Frank C. Webb, of New York, to 6 years each. Two others were sentenced to imprisonment for 4 years; 12 others for 3 years; 4 for 2 years; and 6 for 1 year and 1 day. All terms of imprisonment were to be served in the Federal Penitentiary at Leavenworth, Kan. Six, including Edward Clark, who confessed, were given suspended sentences, and two were set free.

At the time of imposing sentence Judge Anderson stated that many of the accused were guilty of murder; but since they were not then charged with that crime he could not sentence them for it. In speaking of the motive which had actuated the defendants he said: "Every-one of these explosions was upon the work of

open-shop concerns. Since the arrest of the McNamaras and McManigal the explosions have ceased. This system of destruction was not carried on for revenge or in obedience to any other human passion, but for the deliberate purpose, by a veritable reign of terror, to enforce compliance with the demands of the Iron Workers upon the open and closed shop question." It was widely believed that the outcome of this most important of all criminal cases in the labor history of the United States would serve in part to discredit the whole union movement in the minds of the American people. Many believed it would force upon trade unions better systems of organization and control and more reasonable methods in the conduct of trade disputes. But there were those who held that this experience would intensify the class consciousness of the working class, serve to embitter the feelings of class hatred, and prove to be a forerunner of radicalism in the American labor movement.

THE DARROW TRIAL. Growing out of the trial of the McNamara brothers for conspiracy in blowing up the *Los Angeles Times* building were charges that Clarence Darrow, the attorney for the defense, had connived at efforts to bribe jurors. In November, 1911 Bert H. Franklin, chief detective of the McNamara defense, was arrested on a charge of bribing a juror named Lockwood. About February 1, Franklin confessed that he had bribed Robert F. Bain, another juror, and had attempted to bribe five others, including Lockwood. On January 29 Darrow was indicted for alleged bribing of Bain and Lockwood. Trial on the Lockwood indictment was begun May 15, and continued thirteen weeks and two days. Evidence was presented designed to show that Darrow furnished the money to intermediaries with which to do the bribing. The defense, however, alleged that the McNamaras had pleaded guilty before the alleged bribing of Lockwood and that therefore there was no reason for corrupting jurors. On August 17 a verdict of acquittal was rendered. There remained the second indictment for bribing the juror Bain which was called to begin at Los Angeles January 20, 1913.

LEGISLATION. Only a few laws were enacted in 1912 relating to trade unions and trade disputes. Arizona prohibited blacklisting; it defined carefully the term black list, making it include any name or list of names whether written, printed, or spoken, given with an agreement that the receiver will discharge or refuse employment. Massachusetts has heretofore provided that an employer in whose plants a strike or lockout existed must so state in his advertisements for employees; this provision was made inoperative after the State board of arbitration and conciliation has declared that the employer's business is being carried on in the normal manner and to the usual extent. The Mississippi legislature passed a concurrent resolution expressing sympathy for the striking employees of the Illinois Central Railroad and expressing the hope that organized capital may be compelled by public opinion to recognize organized labor. New Mexico forbade employers from in any way preventing or hindering a discharged employee from obtaining employment elsewhere.

Probably the most interesting trade-union legislation of the year was that portion of the

post office appropriation act which provided that membership in an organization of postal employees seeking better conditions of labor for its members shall not be a cause for unfavorable discrimination. The law stated, however, that this shall be true on condition that the union of postal employees shall not be affiliated with any other organization imposing an obligation to participate in a strike or assist in any strike against the United States. Moreover, the postal employees may not be penalized for petitioning Congress or any member of Congress or for furnishing information to them. Trade union publications are to be admitted as second-class mail matter.

GREAT BRITAIN. The year 1912 was notable for the strikes of the transport workers and the miners (see **STRIKES AND LOCKOUTS**), the enactment of a minimum wage law for the miners (see **MINIMUM WAGE**), for the growth of mutual understanding and the policy of concerted action among unionists, and for the increasing evidence of the acceptance of syndicalist policies by the radical labor leaders (see **SYNDICALISM**). The total membership of all trade unions was estimated at nearly 3,000,000; they numbered 2,435,704 in 1910. The seamen's union more than trebled its membership; the unions representing canal, dock, and riverside workers increased by 187 per cent. during the year ending September 1; railway unions increased decisively; and there was a considerable increase in the organization of unskilled laborers.

There were many evidences of a great extension of the idea of federation or amalgamation among trade-union leaders. The growth of combinations among employers which goes on steadily could be met in no other way than by wider and wider unions of workers. Thus the seamen, dockers, and carters have realized the great advantage of an amalgamation into one transport workers' union. Their unsuccessful strike of the summer (see **STRIKES AND LOCKOUTS**) showed the advantage of their alliance with the railway men. Similarly other trade disputes have taught the various railway unions and unions in the iron and steel industries the advantage of federation. Another stimulus to the same end was the success of the Miners' Federation in winning a minimum wage by legislative action. The tendency toward a grand federation of all unions was shown by the active negotiations under way for the amalgamation of the Trades Union Congress and the General Federation of Trade Unions.

A board of trade report on the hundred principal unions comprising about 60 per cent. of the total trade union membership showed their total income in 1910 to have been £2,691,000 and total expenditures about the same. Owing to the depression following 1907 and consequent great increase in benefits paid the total funds on hand decreased £520,000 from 1908 to 1910. Thus the unemployment benefits paid during 1908 and 1909 aggregated nearly £2,000,000. Superannuation benefits have also been increasing steadily during the past few years.

The British Trades Union Congress held its annual conference at Newport, December 2. It was attended by 502 delegates representing 1,967,000 members. This was an increase in membership of 305,000 over 1911. The deliberations of the congress considered 32 resolutions.

These included the proposal for a general eight-hour bill to be presented to the House of Commons; the simultaneous demand on the part of all trade unionists for an increase of \$1.25 per week in wages for all grades of workers on account of the increased cost of living; the question of political action and direct action, involving resort to the general strike; the amalgamation of all existing trade unions by industries, as, for example, the organization of one central industrial association out of the seventy-odd unions now existing in various branches of the building trades; the half-time system in certain machine trades. Without abandoning its policy of seeking ends through political action, as by parliamentary representation, the congress refused by a vote of 1,123,000 to 550,000 to condemn and oppose syndicalism, or direct action. *The Daily Citizen* in both London and Manchester, in the interest of labor, was begun in the late fall. It was financed primarily by the unions, the board of directors including members of trade unions of the Labor party, and of Socialist organizations.

GERMANY. At the close of 1911 the total average membership of all trade unions was found to be 3,042,000, being an increase of 354,000 over the preceding year. These members were included in 137 national unions and a few local unions. Of the national unions 51 were affiliated with the General Commission of Trade Unions, including 2,321,000 members; 23 with the Federation of Christian Trade Unions, a group which favors a close connection between the labor movement and the churches, especially the Catholic Church, comprising 341,000 members; 18 national unions and 7 local unions affiliated with the Hirsch-Duncker Trade Unions, aggregating 108,000 members. Some 40 local unions comprised 272,000 members. The membership of the Hirsch-Duncker unions decreased 12 per cent., the other groups increasing about 15 per cent. Among the general commission unions, the miners, furriers, shipwrights, and wood-engravers experienced slight decreases in membership, whereas the building trades unions, the metal workers, the transport workers, and the general factory workers unions increased decisively. The national unions comprised 11,669 local branches, of which 1051 were in the building trades, 874 among woodworkers, 816 among miners, 738 among carpenters, 724 among painters, and 542 among general factory workers. The organization of women workers progressed rapidly, membership reaching 191,332, or 8.2 per cent. of the total membership. The total income of the 51 national unions affiliated with the general commission was \$17,164,000; their expenditures, \$14,292,000. Their total funds on hand January 1, 1912, amounted to \$14,787,000. The principal expenditures included \$4,120,000 for strike and lockout benefits, \$5,089,000 for benevolent benefits, \$583,000 for official publications, \$1,800,000 for unemployment benefits, and \$2,500,000 for sick benefits.

FRANCE. The principal organization of labor in France is the *Confédération Générale du Travail* organized in 1895. Its membership at its annual convention at Havre, September 17-22, was placed at 600,000. It is composed of representatives from about 150 labor exchanges (*Bourses du Travail*) and the trade unions proper known as *Fédérations de Syndicats*. The former are subsidized by the various cities but

have come largely under the control of the radical trade union leaders. The *Syndicats* represent the aggressive organizations among the French unionists. The most active committee of the General Confederation is the committee on strikes, including the general strike. It is through this committee that the philosophy of Syndicalism, which derives its name from *Syndicats*, has made itself manifest in the labor movement and in trade disputes. See SYNDICALISM.

At its 1912 convention the General Confederation of Labor considered the following subjects: The English week, including the Saturday half-holiday and the eight-hour day; anti-militarism; working-class pensions; and the high cost of living. Probably the most interesting session of the convention was that involving a discussion of the principles of Syndicalism which were reaffirmed by a vote of 1057 to 35. The resolution adopted included the following: "Syndicalism aims at the coordination of the workers' efforts, the improvement of the welfare of the workers by the realization of ameliorations, such as reduction of hours and increase of wages." As concerns the organization, the congress declared that, "In order that 'Syndicalism' shall attain its maximum effect, economic action ought to be aimed directly against the employing class, the confederated organizations not having, as syndical groups, to occupy themselves with parties or sex which, otherwise, may pursue, in full liberty, the social transformation." The discussion was marked by vituperative epithets directed against the Marxists and those trade unionists who would seek relief through political action.

TRANSMISSION OF ELECTRIC POWER.

The tendency to increase the upper limit of transmission pressure continues without abatement. The number of 100,000 volts systems has increased markedly in 1912 and experience indicates that the difficulties in sustaining continuous operation are not sensibly greater at this voltage than at the pressures previously employed. During the year the Au Sable Electric Company put into service a 140,000 volt line 250 miles long, establishing a new record for operating voltage. The Pacific Gas and Electric Company in California has under construction lines for 150,000-volt operation. The present tendency in American plants is to use an average voltage of about 750 per mile of line. There would appear to be no physical barrier to the use of much higher voltages whenever economic conditions warrant. There is gradual progress in the evolution of insulators toward a type which will resist the tendency to puncture when subjected to abnormal voltage until the strain is removed by flash-over or the discharge of lightning arresters. An important practical advance in line protection is afforded by the arcing-ground suppressor which places a momentary ground on the line at the power station when an arcing ground occurs on the line, thus affording an important measure of protection to line insulators. In the design of waterpower stations there is a marked tendency to introduce water-

wheels of very large capacity. Units of 10,000 horsepower for low heads and of 16,000 to 24,000 horsepower for high heads are frequently used. In some cases the efficiency obtained at best load approaches 85 per cent. There is also gradual progress in improving the efficiency at fractional loads. In overhead transmission aluminum conductors have increased greatly in popularity in Europe and in Canada, while in the United States they have been sparingly introduced. Through the artificial control of its market price in America due to tariff protection the economic advantage of about 35 per cent. is eliminated, when the higher cost of erection and handling is taken into the account.

A large number of projects of unusual importance were begun in 1912. It was decided to proceed with the development of an extensive chain of plants in connection with the Los Angeles reservoir and aqueduct system. Seven power plants are planned, the first of these to be 40 miles north of Los Angeles, with three 7500 kilowatt units of immediate and six of ultimate capacity. The system is to be gradually extended to a total of 90,000 kilowatts. The transmission is to be at 100,000 volts over several duplicate lines to guarantee reliability. By reason of the extensive hydraulic plant with which it is to be associated the cost is estimated at the unusually low figure of \$80 per kilowatt. The returns from the electric system, it is predicted, will suffice to meet the interest and refunding of the entire bond issue for the combined project. The proposed Hetch-Hetchy water supply system for San Francisco involves the possibility of three plants of a combined capacity of 160,000 horsepower under unusually favorable conditions as to low cost and reliability. The Big Creek project under construction in Central California involves the development of 60,000 kilowatts in two plants utilizing a total fall of 4000 feet. Transmission to Los Angeles will be at 150,000 volts and the distance 275 miles. It is planned to finally extend this system to 120,000 kilowatts. The Appalachian Power Company has installed two plants aggregating 29,000 horsepower in the New River coal district of Virginia and is extending the system to five plants aggregating 75,000 horsepower. At Niagara there have been extensions in the Canadian plants which when completed will make use of the full volume of water permitted by the existing treaty. The amount in use on the American side is already at the limit permitted by the War Department.

The most important project ever undertaken in the Central States is the development of the Mississippi River at Keokuk. The installation is to comprise fifteen 7500 kilowatt units. Of the product, 90,000 horsepower is to be transmitted a distance of 140 miles to St. Louis over two 3-phase lines operated at 110,000 volts. This plant is expected to prove a great stimulus to the development of manufacturing interests in the adjacent region. In the realm of underground cable transmission the greatest advances of late have been made in Germany. The Prussian state railways are operating sections of cable at 60,000 volts, while in Berlin an extensive network at 30,000 volts has been installed. The latter cables are paper insulated and were tested as high as 250,000 volts without failure. The Brazilian government has granted to a syndicate for a period of 70 years the right to

develop waterpower on the São Francisco River. An initial capacity of 200,000 horsepower is provided for, while ultimate extensions to 1,300,000 horsepower are planned.

Statistics show the present waterpower development in the United States to have exceeded 6,000,000 horsepower, of which more than one-half is associated with long-distance electric transmission.

TRANSVAAL. One of the four original provinces of the Union of South Africa (q. v.). Pretoria, the seat of the provincial government, had, according to the census of 1911, 48,607 inhabitants; with suburbs, 57,674 (35,942 whites); Johannesburg, 237,104 (119,953 whites); Krugersdorp, 55,144; Germiston, 54,325; Boksburg, 43,628; Benoni, 32,560; Roodepoort-Maraisburg, 32,578; Premier, 12,608. There were, in 1910, 735 schools for white and 13 for colored and native children, with an average aggregate attendance of 42,531. There are three normal schools. For area, population, production, and trade, see **SOUTH AFRICA**, **UNION OF**. Public revenue for the eleven months ended May 30, 1910 (exclusive of one-half the government's share of profits derived from the diamond mines, reserved for the redemption of loans), £5,585,637; expenditure, £5,909,811; customs revenue, £1,680,203; public debt, May 30, 1910, £40,000,000. Administrator (1912), J. Rissik.

TRAVEL. See **LITERATURE, ENGLISH AND AMERICAN**.

TREATIES. See **ARBITRATION, INTERNATIONAL**.

TRENGGANU. A native state on the east coast of the Malay Peninsula; a British protectorate (6000 square miles). Population (census March, 1911), 154,073 (10 Europeans, 149,379 Malays, 4169 Chinese, 61 Indians, 454 of other races). Kuala Trengganu (13,991 inhabitants) is the capital and is built on both banks of the mouth of the Trengganu River. The following articles are produced for export (value in Straits Settlements dollars, 1910)—fish, SS\$ 464,288; tin ore, 313,177; copra, 281,813; paddy, 174,295; black pepper, 152,707; rattans, 28,039; rice, 24,746; rawhides, 14,946; dammar torches, 12,251. A British agent (W. D. Scott in 1912) administers the state; native sultan, Sir Zainal Abidin ibni Almerhum Ahmad.

TRINIDAD AND TOBAGO. A British colony, composed of the West Indian islands of Trinidad (1754 sq. miles) and Tobago (114). Total population (1911 census), 330,093 (86,373 East Indians). Capital, Port of Spain (1911 census, 59,658); San Fernando (8607) is thirty miles south of the capital. Under cultivation, about 423,600 acres.

* Beginning with 1909 trade figures are for calendar years. Tonnage entered and cleared. a Cacao, £1,230,097; domestic produce (£1,407,814 total); asphalt, £180,865; raw sugar, £723,949; balata, £261,105; hides and skins, £105,331; raw rubber, £58,168; coconuts, £72,557; coal, etc., £44,370; spirits (bitters), £33,521; molasses, £10,433; specie (gold), £80,601.

Total railways open, 81½ miles (all government lines). Extensions are projected to Si-paria from San Fernando (16¼ miles) and from Tabaquite to Poole (13). The latter was begun September 30, 1911. Sir G. R. Le Hunte was governor in 1912.

TRINITY COLLEGE. An institution for higher education at Hartford, Conn., founded in 1823. The number of students enrolled in the various departments of the college in 1912 was 253. The faculty numbered 22. The most noteworthy change in the faculty during the year was the appointment of Professor George B. Viles to the chair of Romance languages to take the place of Professor John C. Gill, retired. In the latter part of October the announcement was made that Mr. J. Pierpont Morgan had given the sum of \$100,000 for the building of a new library and administration building for the college. The productive funds at the end of 1911 amounted to \$1,210,106 and the income for 1911-12 was \$76,653. The volumes in the library numbered 65,000. President, F. S. Luther, LL. D.

TRIPLE TURBETS. See **NAVAL PROGRESS, and BATTLESHIPS**.

TRIPLEX GLASS. See **CHEMISTRY, INDUSTRIAL**.

TRIPOLI. A country bordering on the Mediterranean coast of Africa, between Tunis and Algeria on the west and Egypt on the east, and bordered on the southeast and south by the Sahara. As a result of the Turco-Italian War, Tripoli, hitherto a vilayet of the Ottoman empire, was proclaimed at Rome, November 5, 1911, together with Cyrenaica, a province of the kingdom of Italy. The area, with Cyrenaica (or Bengazi, or Barca), is estimated at 405,800 square miles, and the population at about one million. Tripoli, with 40,000 inhabitants, is the capital of Tripoli; Bengazi, with 25,000, of Bengazi, both Mediterranean ports.

The trade stream flows through these ports, and is fed by the caravan routes across the Sahara, which are the natural outlet by which Sudanese trade reaches the sea. As certain of the oases which make practicable the most traversed of these routes are in the territory long disputed by Turkey with France in behalf of Tunis, and with Great Britain in behalf of Egypt, the delimitation of Tripoli is now imperative and will undoubtedly be the source of much diplomatic discussion by the three powers involved. As this southern commerce becomes increasingly important it is probable that railway construction will be undertaken (a short line from Tripoli to Ainzara was under construction in 1912); but for the present the measures indicated are pacification of the hinterland tribes and an effective policing of the existing routes. Caravans now cross the Sahara in from three to five months, according to the route taken and the number and strength of robber bands to be overcome.

The total commerce of the country is reported for 1909 as follows: 10,941,605 lire imports, 5,934,151 lire exports (esparto, hides and skins, ostrich feathers, sponges, live animals, wool, cereals, etc.). The revenue has been derived from taxation on the wealth of the individual and from tithes.

No civil governor had been appointed by Italy at the end of 1912. The final draft of the treaty of peace between Italy and Turkey was signed October 18 by the delegates at

Ouchy, Switzerland. It provides for complete Italian sovereignty in "Libya" (Tripoli and Cyrenaica) without formal recognition by Turkey; for the caliph's retention of free religious authority; for the withdrawal of Turkish troops; for the reestablishment of former diplomatic and commercial relations, etc. With the withdrawal of Turkish troops, however, hostility to Italian occupation is not ended. The fierce and fanatical Mohammedan tribes of the hinterland remain to dispute every inch of their territory with the invader. See TURCO-ITALIAN WAR.

TRIPOLITANIA. See EXPLORATION.

TRISTRAM, THOMAS H. An English jurist and church official, died March 8, 1912. He was born in 1825 and was educated at Durham School and Lincoln College, Oxford. In 1855 he became an advocate of Doctors' Commons. His first appearance in connection with clerical cases was in behalf of Mr. Mackonochie in the first appeal to the Privy Council in 1868. In the various stages of this famous case Dr. Tristram was retained. The case related to charges made for alleged ritual offenses and was followed by the passage of the public worship regulation act of 1874. In 1888 an appeal was made to the archbishop of Canterbury for a citation against a bishop for alleged ritual offenses. The archbishop dismissed the petition and the petitioners thereupon appealed to the Privy Council. Dr. Tristram, then a Queen's counsel, appeared, with two other advocates. A board of five bishops allowed the appeal. Thus began the great suit of "Read against the bishop of Lincoln." Dr. Tristram had many official appointments. He was commissary of the city and diocese of Canterbury, and chancellor of the dioceses of London, Hereford, Ripon, Wakefield, and Chichester. Though a layman, letters patent appointing him chancellor entitled him to issue marriage licenses and other canonical dispensations as vicar-general of the bishop. In 1903 he offered to license the marriage of divorced persons, but the bishop of London formally disowned his chancellor's action and pronounced his licenses of doubtful validity. The chancellor, however, continued to issue such licenses to the end. He was the last member of that historic body of practitioners who were known as advocates of Doctors' Commons, whose qualifications were not those belonging to one of the four Inns of Court, but the possession of a degree in law of one of the universities. He twice stood for parliament, as a Conservative candidate in 1880 and in 1885. He was both times defeated.

TROTTER, LIONEL JAMES. An English lawyer and writer, died May, 1912. He was born in 1827 at Calcutta, and was educated in the Charterhouse School and at Merton College, Oxford. He went to India in 1847 as a cadet of Bengal infantry and served in the British army until 1862, retiring in that year with the rank of captain. He wrote much on Indian subjects. Among his published writings are, *Studies in Biography and British Empire in India* (1865), biographies of Warren Hastings, Dalhousie, and John Nicholson, *History of India* (1874), and *The Bayard of India*

1912-48

(1903). He also contributed to several Indian and English newspapers.

TRUSTS. The amount of attention given to the trust problem in 1912 was probably equal to that of any preceding year. Not only did it figure prominently in the political campaign, but the numbers of prosecutions completed, of new ones begun, and of those advanced, were unusually numerous. Its prominence in the political campaign led to an unusual volume of newspaper and periodical literature dealing with the subject. A summary representing all the different views, based on a report of a session of the American Academy of Political and Social Science, is given below. The principal suits terminated during the year included those against the Aluminum Trust, the Beef Trust, the Wallpaper Trust, the Bathtub Trust, the Harriman lines, the anthracite coal roads, the St. Louis Terminal Railroad Association, and the criminal suit against officers of the American Sugar Refining Company. Suits were begun against ten steamship companies engaged in trade between Atlantic ports and the Far East; four steamship lines alleged to have monopolized American traffic with Brazil; the National Cash Register Company; the United Fruit Company; the Atlantic steamship lines on account of a compact for the transportation of steerage passengers; the Motion Picture Patents Company and the General Film Company, constituting the Moving Picture Trust and including ten corporations; the Elgin Board of Trade, known as the Butter Trust; the Brazilian valorization scheme, known as the Coffee Trust; the Kellogg Toasted Cornflake Company for dictating prices of retailers; the Harvester Trust; the United States Steel Corporation; various corporations known as the Horseshoers' Trust at Detroit; and the Candy Trust, or the Philadelphia Jobbing Confectioners' Association. Investigation of the New Haven Railroad for monopolization of traffic in New England by checking the extension of the Grand Trunk Railroad and control of trolley and seaboard transportation was under way at the close of the year; the presidents of these two railways were indicted under the criminal sections of the Sherman law by the Federal Grand Jury at New York on December 23.

The Harvester Trust suit was brought at St. Paul on April 11 against the International Harvester Company, including seven corporations and eighteen individuals. The government charged that this trust controlled 90 per cent. of the harvester trade, 75 per cent. of the trade in mowing machines, and was seeking to monopolize the production of all kinds of agricultural implements; that it had absorbed competing companies, then pretended that they were still independent; and that it used unfair methods in driving other competitors out of the field and otherwise in the conduct of its business. The capital of the trust was placed at \$140,000,000. This suit acquired special interest through the fact that Mr. George W. Perkins, a large contributor to the expenses of the Roosevelt campaigns, was a prominent director. Hearings were being held also in Chicago and St. Louis at the close of the year. On November 20 the president of the company admitted that it had reduced prices to drive out rival companies.

Shortly after the suit against the Butter Trust in December the Elgin board reorganized

and amended its rule of seventeen years' standing, whereby prices had been arbitrarily fixed by its quotation committee, and adopted the plan of allowing actual sales of butter as related to its supply to determine the price.

Suits that were merely advanced during the year included those against the Key-Stone Watch Company, or Watch Trust; against the United Shoe Machinery Company, the American Sugar Refining Company, and the Lumber Trust. A committee of the House of Representatives under the chairmanship of Representative Pujo prosecuted an inquiry into the alleged Money Trust.

Late in April the Supreme Court declared the St. Louis Terminal Association, which controls railroad entrance to the city and passage across the Mississippi River, a monopoly in restraint of trade. The decree permitted a reorganization under specific conditions. In May the government and the Powder Trust agreed upon a decree for dissolution. Late in May the suit against the Wallpaper Trust at Cleveland was terminated, the eight defendants being acquitted. By mutual agreement the Aluminum Company of America, or the Aluminum Trust, was enjoined from using unfair methods, the company promising to reorganize in lawful form. In March several officers of the American Sugar Refining Company were brought to trial under the penal division of the Sherman act. On November 31 the jury failed to agree and the defendants were discharged. The weakness of the suit was due to insufficient evidence available under the statute of limitations. The government finally dismissed the criminal indictments in December. This, however, did not terminate the civil suit for the dissolution of the Sugar Trust, hearings in which were being held in Philadelphia at the close of the year.

OPINION. The most comprehensive and authoritative discussion of the trust problem during the year occurred at the meeting of the American Academy of Political and Social Science in March. As reported in the *Annals* of the Academy for July, nearly every phase of the problem of "competition versus combination" was presented. With reference to the effect of combination on labor several labor leaders, especially those in the steel industry, contended that conditions had been better before combination; but representatives of manufacturers endeavored to show that "the labor conditions in the large factory are better than in the small one," as regards wages, sanitation, protection from machinery and fire, rate of work, and fairness of the management. See **UNITED STATES STEEL CORPORATION**, paragraph *Labor Conditions*, and **WELFARE WORK**.

The majority opinion strongly favored competition as a better basis for industrial progress. Prof. John Bates Clark of Columbia, though assenting to the need for a government bureau with power to charter corporations doing interstate business, presented clearly the necessity and advantage of preserving competition, at least in its potential form, as a regulator of prices, a stimulus to industrial progress and, in general, a protection of the public. Prof. Bruce Wyman of Harvard pointed out the unfair competitive methods of the monopolistic corporation, including railroad rebates, the abuse of patent laws, the establishment of bogus competing concerns, bribery of competitors' employees,

factors' agreements, local competition, and various other devices for price-control. Prof. E. S. Meade of the University of Pennsylvania declared that the supposition that the trust, as a type of business organization, is superior to the individual concern is a fallacy, as shown by comparison of the United States Steel Corporation, a huge unnatural composite, with the Pennsylvania Railroad, a single united naturally evolved business organization. Some speakers were inclined to point to the increase in international trade as evidence of the economic superiority of the trust, while others declared this expansion had been secured largely at the expense of the American public since higher prices were charged at home than abroad.

OTHER COUNTRIES. Some time was devoted to the discussion of the policies of different countries, particularly Canada, England, France, and Germany towards combination. Mr. Francis Walker of the Bureau of Corporations classified the legal attitudes as follows: (1) Complete legality of combinations, as in Germany; (2) invalidity of combinations when they are of the nature of conspiracy under the civil law, as in England; (3) prohibition under the criminal law, as in Canada and the United States. In Germany the cartels are encouraged by the government, as a rule, but this must be connected with the policy of extending government ownership and enterprise. The German law hinders financial excesses and promotes publicity, the states and nation own the railroads, and most of the state governments produce such raw materials as coal, lumber, and potash. In England the judicial attitude is that the ordinary trade or industrial combination is not a conspiracy at common law and therefore not illegal. Moreover, opinion and the government hold that although there are numerous combinations in existence, some of which are doubtless injurious to public welfare, yet the existence or free trade with the ease of foreign competition prevents serious evil to the English public. In Canada the Combines Investigation act of 1910 has been a check upon unfair combinations. This provides for public investigation of an alleged combine and relies upon public opinion to give due force to the finding of an impartial inquiry. Moreover, other laws place restrictions on the patent rights of combinations and provide for a reduction of tariff duties on goods produced by a trust. Austria-Hungary follows the plan of England, namely, encouragement of competition and relative indifference as yet to the tendency to combine. Most other countries where the problem has arisen have taken the attitude of decisive opposition shown in the United States and Canada.

COMBINATION VS. COMPETITION. The conference brought out characteristic differences as to the naturalness of large combinations and as to the effect of the Sherman law. Some held that the great combinations of 1898-1902 were made in obedience to an inevitable tendency of economic evolution and others that they were the result of a mania for promotion and stock manipulation. Some pointed to the undoubted economies of combination and others were inclined to stress the inefficiencies of management as compared with the small, closely organized and personally supervised organization. Professor Seager of Columbia, though recognizing the economies of combination, showed by a

statistical study of some thirty leading trusts that about half had succeeded, some of them brilliantly, and about half had failed, some of them ignominiously. He was thus inclined to consider competition a sufficient regulator of prices provided it be fair and attended by the publicity which a federal licensing system would introduce. He, however, advocated governmental regulation of prices wherever a combination secured monopoly, just as we to-day have regulation of railroad rates. Moreover, with the perfection of public administration he thought public ownership of railroads and industrial monopolies would be reasonable and proper. Speaking on the question of a constructive trust policy, President Taft and Attorney-General Wickersham both declared strongly for the continued enforcement of the Sherman law and the creation of a federal licensing system. Commissioner of Corporations Herbert K. Smith said that whether one would rely on competition or prefer to permit combination, experience shows the necessity of a federal authority similar to the present Bureau of Corporations but with greatly enlarged powers to secure information and publicity. Throughout the discussion the need of publicity and the consequent formation of an intelligent public opinion was reiterated. Mr. James M. Beck of New York declared that the courts do not understand what is meant by restraint of trade and that the Supreme Court in the Standard Oil and Tobacco decisions has plunged the whole subject "into a fathomless morass." He favored the Canadian method of reliance on an informed public opinion.

PROPOSED BILLS. Two of the speakers presented outlines of bills before Congress designed to cure the existing evils of the trust situation. Congressman Ernest W. Roberts's bill was copied largely after the Massachusetts corporation law, but in addition provided for more complete publicity. It prohibited the watering of stock; required all capital to be paid in before business was begun; prohibited the issue of stock or scrip dividends; required that all issues of stocks and bonds after the first be approved by the commissioner of corporations; and provided joint fine and punishment for violations. It aimed to prevent the formation of boards of interlocking directors by forbidding a director of one corporation to serve as a director in more than four others. The scope of this proposed law was limited to those interstate corporations whose total valuation exceeds five million dollars. Senator John Sharp Williams of Mississippi found the chief source of present evils in the multiplicity and liberality of State legislation. He held that all the great evils of combination have grown out of the law-conferred or law-permitted privileges granted in State charters. He, however, opposed federal incorporation because it would tend to governmental and industrial centralization; he also opposed the federal license idea because that would tend to bureaucracy, a government of men and not of laws. His remedy, therefore, would be a congressional enactment refusing the privilege of interstate commerce to those corporations that are now permitted by State charters to exercise evil methods or exert injurious powers, such as ownership of stock of competing concerns, factors' agreements, and other unfair methods.

ANTHRACITE COAL. The suit begun in 1907

in the circuit court for the Eastern District of Pennsylvania against the Reading, the Lackawanna, the Lehigh Valley, the Central Railroad of New Jersey, the Erie, and the New York, Susquehanna, and Western railroads and their nine subsidiary companies for maintaining a combination in the mining and transportation of anthracite coal was ended by the decision of the supreme court on December 16. The decision of the circuit court in this suit rendered December 8, 1911, was in the main favorable to the defendants, but found that the Temple Iron Company, whose stock was owned by these roads, constituted a violation of the Sherman law. The case was considered an important one in its bearing upon further elucidation of the significance of the anti-trust law. The evidence showed that shortly after 1900 when numerous contracts between the coal-carrying roads and independent mine operators were expiring, plans were made for the construction of an independent railroad to be called the New York, Wyoming, and Western. The defendant road then formed the Temple Iron Company for the purpose of preventing the construction of this road. They thus retained, in their own hands, control over all transportation for the anthracite fields, and indirectly retained considerable power over the independent operators. Although the supreme court held that the government's allegation that there existed a general combination in the nature of a pooling arrangement among the six roads was indefinite and not sustained, it did declare the Temple Iron Company unlawful and ordered its discontinuance. The coal-carrying roads produced in their own mines about 75 per cent. of the total output of anthracite coal; independent mines produced only 25 per cent. Furthermore, by means of contracts known as the 65 per cent. contracts by which independents producers had bound themselves to deliver the output of their mines to the railroads for 65 per cent. of the average tide-water market price, the roads had acquired a virtual monopoly in the handling of anthracite coal. The court held these contracts invalid because in violation of the anti-trust law. Finally the court reiterated a declaration made in the Standard Oil case that the anti-trust act does not "forbid or restrain the power to make normal and usual contracts to further trade by resorting to all normal methods whether by agreement or otherwise."

A new inquiry was begun in December at the Attorney-General's direction, to determine whether there remained a basis for another suit against the anthracite coal interests.

UNION PACIFIC-SOUTHERN PACIFIC. On February 1, 1908, suit was begun in the United States circuit court for the District of Utah against the Union Pacific, Oregon Short Line, Oregon Railroad Navigation, the Southern Pacific, San Pedro, Los Angeles and Salt Lake, and the Atchison, Topeka and Santa Fé companies, and certain individuals for combination and conspiracy in violation of the Sherman act through the formation of a railway system in restraint of competition. On June 23, 1911, the circuit court rendered a decision dismissing the suit on the ground that the government had not shown the Union Pacific and Southern Pacific railroads to have been competing lines. Judge Hook dissented from that decision. The case was argued before the supreme court early

in the year, decision being rendered on December 2. By a unanimous decision the court declared the combination to be in violation of the trust statute. It ordered the dissolution of the merger and required that plans for accomplishing this end should be presented within three months; otherwise the court declared its intention to proceed by receivership and sale, if necessary, to dispose of stock so as to dissolve the unlawful combination. This case grew out of the acquisition of 46 per cent. of the stock of the Southern Pacific Company by the Union Pacific Railway. The court held that, although in a small corporation a minority interest might not amount to control, nevertheless such a large minority holding as 46 per cent. in a large corporation with many scattered stockholders is ample to control the operations of the corporation. The court also declared that the trust law makes no difference between stock control acquired by means of a holding company, as in the Northern Securities case, and control by outright purchase of the stock of one corporation by another. It found that domination and the power to suppress competition are acquired in either case. It also found evidence to show that real competition had existed between the parallel lines of the Southern Pacific and the Union Pacific before the merger. The court even declared that mere ability to stifle competition is practically the same as engaging in such stifling. In December this case again came before the supreme court on a motion to determine whether the stock of the Southern Pacific held by the Union Pacific should be sold to stockholders of the latter road only or to those of both roads. The plan for dissolution had not been worked out at the close of the year, although the Attorney-General had declared that the government would not accept the plan for direct distribution of stock to Union Pacific stockholders.

MINOR COURT DECISIONS. On December 2, the supreme court reaffirmed a previous decision declaring unconstitutional the corporation law of Kansas closing the courts of that State to foreign corporations which had not secured certificates to do business in that State. The law was declared unconstitutional as a burden on interstate commerce. On the same date the supreme court affirmed the constitutionality of the South Dakota anti-monopoly act of 1907. This law makes it a crime to sell a commodity in general use to a dealer in one place at a rate lower than to dealers in other places in the State with the intent to ruin competition. Laws similar to this, designed to destroy local competition, have been enacted in various northwestern States and are considered one of the most rigorous and effective anti-monopoly devices yet formulated.

PATENT LAW. One of the most important judicial decisions of the year and one giving rise to national discussion of "patent monopoly," was that handed down by the United States Supreme Court in the case of Henry vs. The A. B. Dick Company. The latter company manufactured a rotary mimeograph sold "with the license restriction that it may be used only with the stencil paper, ink, and other supplies made by the A. B. Dick Company." A Mr. Henry sold ink to a purchaser of one of these mimeographs, knowing the purchaser's intention to use it with the latter. The su-

preme court, by a vote of 4 to 3, declared Henry's act to constitute contributory infringement of the Dick Company's rights under the patent law. The point at issue was whether such a restriction as the Dick Company sought to impose—that is, a regulation of the materials that might be used in connection with its patent—was a right under the patent law or merely a contract between buyer and seller. In the former case the rights of the manufacturer of an article would be enormously extended. The majority opinion, based on a long line of decisions, held that the intention of the patent law is to give an exclusive monopoly during a limited period, and therefore, if the purchaser of a patented article knows in advance of the restriction on its use, any limitation whatever may be imposed by the patentee. The opinion also held that if this interpretation be injurious to the public interest, remedy lies in congressional action. Chief Justice White, in a dissenting opinion, held that the decision would destroy a large part of the judicial authority of the State courts, and extend, to an unwarranted degree, that of the federal courts. He held that the principle laid down in the majority opinion was "as broad as society: capable of operating upon every conceivable subject of every human interest or activity." On the basis of numerous decisions he objected to the reasoning of the court whereby the patent law is made to include unpatented articles; this he declared to be judicial legislation of a most dangerous kind. He held that the patent law extended only to the machine and that any control of material used therewith was merely a private contract. Though this decision was rendered by a divided court and less than a full bench, application for a re-hearing was denied on April 8.

UNITED SHOE MACHINERY COMPANY. Suit was begun in the United States district court at Boston against this company on five counts, four of which charged criminal conspiracy in restraint of trade. These four counts were dismissed on March 2. There remained only the charge of monopoly through a system of leases of patented machinery. In the fall the court ruled that hearings in this suit should be secret, thus arousing public comment and special condemnation from Attorney-General Wickersham. This fifth charge was finally dismissed by the court on the ground that its interpretation of the patent law showed no violation of the Sherman act. The government, however, took the case to the supreme court on December 22. Its contention was that the patent lease agreements whereby this company manufactured and retained control of 80 per cent. of the business in its line resulted in the maintenance of an illegal monopoly. This case appeared to be quite similar to the Dick patent case noted above.

BATHTUB TRUST. Civil suit at Baltimore and criminal suit at Detroit were begun in the circuit courts against the Standard Sanitary Manufacturing Company and numerous other defendants in 1910. In the criminal suit against certain individuals decision in which was rendered early in 1912 the jury failed to agree. Near the close of the year it was announced that a retrial of this case would be begun at Detroit, February 3, 1913. The defendants in the civil suit included the above company and 49 other parties, one-half of

whom were other companies manufacturing 85 per cent. of the sanitary enameled ware made in this country. These concerns were licensed to use a patented dredger in spreading enamel upon an iron base on signing the following patent license agreement: to abide by an established price list, not to sell to jobbers who bought of independents nor in certain territory, and not to sell "seconds." They forced retailers to sell at fixed prices. Moreover, the manufacturers assenting to the license agreement were punishable by a system of fines if they broke any part of it. The circuit court in 1911 held that the ownership of a tool gave no monopoly right over the products made therewith. In a unanimous decision in November, the supreme court declared that there could be no monopoly in the unpatented product of a patented machine. The defendants put their main reliance on the opinion of the supreme court in the Dick patent case above noted. The court, however, did not find the cases comparable. These defendants really sought to effect a monopoly of trade by control of unpatented articles; they sought to fix the price not of a patented article, or of materials believed necessary to the use of such article, but rather of unpatented products.

The suit was one of the most important yet terminated under the Sherman act. This combination commenced operations in June, 1910. The Attorney-General commenced proceedings in July, 1910. Following the circuit court decision of 1911 prices of the defendants' products fell from 25 to 40 per cent. It has become more and more common for manufacturing concerns to endeavor to control the retail price of products by some sort of patent license agreement. Numerous cases having shown the trust plan and the holding company plan of combination to be illegal, refuge is taken behind the patent laws.

BEEF TRUST. A criminal suit was begun against the National Packing Company and others in September, 1910. The defendants included the ten principal owners of the Swift, Armour, and Morris Packing companies, who were charged with violating the Sherman law by a conspiracy in restraint of interstate commerce. Trial of the case began in December, 1911. The government traced the history of the combinations of the beef packers; exposed their system of price making; set forth the operations of pooling agreements by which territory and business were divided, and traced the history of price wars to drive out competitors and of absorptions of the more successful competitors. The defense claimed that the National Packing Company did not fix prices or control trade; that its function had been mainly to prevent an over-supply of fresh meat; and that there were several hundred competitors who transacted about one-third of the domestic trade. On March 26 a verdict of not guilty was rendered. The suit cost the government \$100,000 and the defendants \$500,000. In June, 1912, the National Packing Company announced that it would voluntarily dissolve. The Attorney-General thereupon announced that further proceedings to compel dissolution would be held in abeyance. The *New York Journal of Commerce* stated that this company was used to acquire control by holding stock of about 350 principal packing plants in St. Louis, Omaha, Kansas City, and

other western and eastern cities, including the New York Butchers' Dressed Meat Company, the Stock Yards Warehouse Company, the Anglo-American Refrigerator Car Company, and the Fowler Canadian Company. The announcement of voluntary dissolution was not taken seriously by the press as it was not expected to affect concerted control or to lower prices.

TOBACCO TRUST. The dissolution of the American Tobacco Company in 1911 did not prove satisfactory to the independents and to certain members of Congress. It was alleged that control was unaltered and that competition was not restored. In April the supreme court refused to review the dissolution decree. At once efforts were made in Congress to secure the passage of the Cummins bill giving the independents the right to appeal to that court. About the same time the United States district court at New Orleans punished, by fine, the American Tobacco Company for conspiring to injure an independent company by unfair business methods. In December damage suits under the Sherman act at New York against the American Tobacco Company and other tobacco concerns were unsuccessful. The court, however, declared that without doubt the defendants did constitute an illegal combination, but that no injury to complainant company was shown. Appeal was taken. In December the dividends declared by the various constituents of the former trust aggregated about \$6,000,000 less than during the two or three years preceding, the total for 1912 being about \$10,000,000. This was, in part, due to the actual division of property and separation of commercial operations effected by the dissolution, and in part to the accumulation of additional capital out of earnings by some of the companies.

COFFEE TRUST. Suit was begun in the circuit court at New York in May against eight persons, mostly foreigners, identified with the Brazilian valorization plan. This was a plan to regulate the price and market supply of coffee and grew out of the low price some years ago due to a large crop. The state of São Paulo and the Brazilian government bought 10,000,000 bags of coffee, borrowing thereon \$65,000,000 from European bankers and \$10,000,000 from a Morgan syndicate. The wholesale price of coffee thereafter rose from 7½ cents in 1906 to 14½ cents in 1912. The coffee purchased under this plan has been gradually sold during years of small crops under the direction of an international supervising committee representing the money lenders. The United States government sought to enjoin the exportation of 950,000 bags of this coffee stored in New York and to secure authority for its confiscation and sale. It failed. The court held that the Sherman act did not extend to goods thus imported. In his annual report the Attorney-General demanded a law authorizing the seizure of goods imported for unlawful combination.

MONEY TRUST. In February, by an almost unanimous vote, the House of Representatives ordered its committee on currency and banking to inquire into the existence of an alleged money trust. The matter was taken up by a sub-committee headed by Representative Pujo. Mr. Samuel Untermyer of New York was employed as counsel. Hearings were begun in April and continued until mid-summer. At

the outset steps were taken to secure from the 25,000 or more banks answers to questions designed to bring out the extent of their affiliations. Many banks refused. Hearings were resumed again early in December. The first subject then taken up was the clearing house association at New York, its membership, and its power over smaller banks. It was the belief of the committee that refusal to permit the Oriental Bank to enter the clearing house in 1907 was responsible for its failure. Evidence was presented showing that an effort was being made to bring about a working agreement between the clearing house associations of Pittsburgh, Cleveland, Columbus, Cincinnati, Indianapolis, and Louisville, in order to regulate charges for collecting out-of-town checks and drafts, as also the rate of interest to be paid on deposits. This was believed to be a combination in violation of the Sherman Anti-Trust law. Evidence was presented justifying the charges of New York banks for collecting out-of-town checks and drafts; and also showing that the associations of Boston and Philadelphia did not make similar charges on the ground that they were expenses similar to clerk hire and lighting bills.

Several days were spent in investigating the stock exchange. Evidences of manipulation and stock juggling were presented. It was shown that the stock transactions in Reading had equalled 44 times the capitalization of the Reading Railroad in a single year. In other cases ratios of 9, 12, 17, and even 30 times the capitalization had been reached. The manipulation of the stocks of the Columbus and Hocking Valley Coal and Railroad companies by James R. Keene in 1909 was brought out in detail; as also the Rock Island fiasco of 1909, and other similar transactions. The ethics of the "short sale" were discussed, witnesses universally agreeing that it was reprehensible. The relation between the banks and the stock exchange was also investigated. It was shown that 35 New York City banks had 19,015 out-of-town correspondents. Nearly one-half of the deposits of these correspondents, or \$240,480,000, had been loaned by these correspondents on stock exchange securities. This was due to the fact that the call money rate in New York was as high as 8, 10, 15, and even 20 per cent. in November, whereas the rate on loans on commercial paper or securities in the various communities represented by these banks was only 5 to 6 per cent. (see BANKS AND BANKING). It was reported that the committee would recommend to Congress the federal incorporation of the New York and other stock exchanges as the only means of protecting the public against manipulations. At the very close of the year the governors of the New York exchange were engaged in working out reforms to meet objections of the committee.

Probably the most striking bit of evidence presented to the committee was that bearing on the existence of a system of interlocking directorates headed by the firm of J. P. Morgan and Company. It was declared that 18 firms with 180 leading members held directorships to the number of 746 in at least 134 industrial, financial, and transportation corporations, with an aggregate capital of \$25,325,000,000. The firm of J. P. Morgan and Company was credited with 33 directorships in 39 corporations with a total capitalization of \$10,036,000,000; the First

National Bank of New York with 103 directorships in 49 corporations with \$11,542,000,000 capital; the Guarantee Trust Company with 160 directorships in 76 corporations with \$17,342,000,000 capital; the Bankers Trust Company, with 113 directorships in 56 corporations with \$11,184,000,000 capital; the National City Bank with 86 directorships in 47 corporations having \$13,205,000,000 capital; the National Bank of Commerce with 149 directorships in 82 corporations having \$18,165,000,000 capital; the Chase National Bank with 69 directorships in 48 corporations having \$11,527,000,000 capital; and the Astor Trust Company with 74 directorships, in 47 corporations with \$12,408,000,000 capital. Other firms included in the list of 18 were: Kuhn, Loeb and Company; the Hanover National Bank; Blair and Company of New York; Speyer and Company of New York; the Continental and Commercial National Bank; the First National Bank of Chicago; the Illinois Trust and Savings Bank of Chicago; Kidder, Peabody and Company of Boston; and Lee, Higginson and Company of Boston. Among the principal corporations in which 180 directors of these 18 banking houses were represented as having an important influence were: The American Telephone and Telegraph Company; the Consolidated Gas Company of New York; the Inter-Boro Metropolitan Company; the Inter-Boro Rapid Transit Company; the electric railway companies of Boston, Brooklyn, Chicago, Philadelphia, and St. Louis; the Amalgamated Copper Company; the American Sugar Refining Company; the following trusts: Tobacco, woolen, beef, leather, powder, electric, rubber, harvester, nickel, paper, biscuit, oil, shoe machinery, and steel; the four principal express companies; 32 railway systems with a total of 167,200 miles, or about two-thirds of the total mileage of the country; 13 leading insurance companies; and 46 principal banks in Boston, Chicago, Philadelphia, Pittsburgh, Providence, St. Louis, Washington, and New York City. The aggregate capitalization of the public utilities corporations included in the list was \$4,440,000,000, and their gross income, \$477,000,000; the capitalization of the industrial companies was \$3,883,000,000 and their gross income more than \$1,300,000,000. These 18 financial institutions were believed to constitute the money trust. On the other hand, Mr. J. P. Morgan in his testimony on December 19 declared a monopoly of credit and money to be impossible. He said that credit is a personal thing being based on character. It was expected that further hearings would be held and that the committee would finally formulate constructive legislation designed to restrain cupidity, to equalize the opportunity for securing business credit, and to induce local banks to render larger service to the business needs of their respective communities. The committee endeavored to induce the comptroller of the currency to gather information for them. Following an opinion of Attorney-General Wickersham, President Taft authorized the comptroller to deliver any information already in his possession, but not to undertake the collection of additional data. See RAILWAYS.

TRYON, JAMES RUFUS. A rear-admiral, retired, of the United States navy, died March 20, 1912. He was born in Cocksackie, N. Y., in 1837, and graduated from Union College in 1858. In 1863 he entered the United States

navy as assistant surgeon, and in this capacity was present at the battle of Mobile Bay. After the war he had charge of the Naval Hospital in Boston and in 1871 was in charge of the temporary smallpox hospital in Yokohama. He served during the yellow fever epidemic in 1873 at Pensacola. He later saw service in Uruguay and Venezuela. The latter country conferred a decoration upon him for his service in caring for the wounded in one of the revolutions. In 1893 he was appointed surgeon-general of the United States navy, and in 1897 he was made chief of the Bureau of Medicine and Surgery. As surgeon-general he did much to bring the service up to a high standard and the result of his efforts was shown in the small mortality in the navy during the Spanish-American War. He was retired as rear-admiral in 1899, and for six years following was in charge of the hospital at Sailors' Snug Harbor, S. I.

TUBERCULOSIS. The sputum of the tuberculous patient is usually considered the single important factor in spreading infection, although it has been recognized that the bacilli find their way into many of the body fluids. That the perspiration of tuberculous subjects not only contains tubercle bacilli, but is markedly infectious, seems to be proved by recent researches. In March, 1912, Professor Poncet of Lyons presented before the Académie de Médecine a study of the subject of the virulence and contagiousness of the perspiration of tuberculous patients, by Dr. Piery, who attended a number of consumptives, most of whom lived in lodgings, each, in many instances, consisting of a single room used by the patient with the patient's wife or husband and numerous children. Dr. Piery was impressed by the absence of tuberculous infection in the children surrounded by ideal conditions of contamination, and by the frequent infection of the patient's husband or wife, who was apparently equally exposed, but capable of taking prophylactic precautions unknown to the children. He endeavored to trace the cause of this apparent contradiction. The researches of Professor Poncet and his pupils with regard to the septicity of the perspiration of the hands and the infection of surgical wounds by perspiration from the hands of the surgeon suggested the idea of investigating the possible virulence of the perspiration of the tuberculous patient as a cause of the frequency of conjugal tuberculosis. It appears from his investigation that the perspiration of a tuberculous patient is virulent in 30.76 per cent. of cases (surgical lesions, tuberculous arthritis, and tuberculous peritonitis, that is to say, in securely closed and slowly progressing lesions). In 41.66 per cent. of tuberculous cases the perspiration may be the vehicle of tubercle bacilli. This elimination of the tubercle bacillus through perspiration seems an argument in favor of the frequent septicemic nature of tuberculous infection. The heavy sweats of the tuberculous may be considered as crises of elimination of the bacillus. At all events, perspiration is one means of contagion, dangerous in itself, directly or indirectly, and should be guarded against by disinfection of clothing and other objects soiled by such perspiration and by isolation of the patient by at least the use of a separate bed.

The extent to which tubercle bacilli circulate in the blood was studied by Rumpf, who declared that his own and others' researches

have confirmed beyond question that tubercle bacilli exist far more often than hitherto supposed in the circulating blood, not only of the tuberculous but also of the healthy. More delicate bacteriologic technic has disclosed their presence with startling frequency. But at the same time inoculation of animals with blood containing the bacilli does not seem to transmit tuberculosis to the animals. Thirty-five guinea-pigs were inoculated with blood containing the bacilli from several patients with advanced tuberculosis, from some with the disease in an incipient form and from three clinically healthy physicians, who all had tubercle bacilli in their blood. Only three of the animals developed tuberculosis and one had dubious lesions. None of the others displayed any symptoms, and when the animals were killed and examined thirty-one weeks later, no tuberculous lesions were found in them. Rumpf suggests that either the bacilli are not viable, or the blood vehicle in which they were injected protected the animal against them. Other experiments in which the bacilli were cultivated in pure cultures from the blood and the animal inoculated with the cultures alone, all resulted positively. Kennerknecht found bacilli in the blood in 91 per cent. of 120 children examined, including 74 per cent. of 31 children supposedly entirely free from tuberculosis. He inoculated guinea-pigs with the bacilli, with positive results.

The rapid spread of tuberculosis in certain parts of South Africa, led to the appointment of a commission by the government to investigate the subject. This commission reported an alarming increase, particularly among the colored races. The primary factor seems to be its introduction into many centres previously free from it by the immigration of consumptive persons who come to South Africa to obtain the benefits of the climate. As a result, stringent regulations are likely to be enforced against the admission of emigrants suffering from open tuberculosis or any form likely to develop into that stage. Tuberculous emigrants may be admitted only at certain ports of entry, under permit to remain in the country for a definite period, under conditions of strict sanitary surveillance, restricted residence, and periodical examination by district surgeons appointed by the government. See **INDIANS** and **AGRICULTURAL EXPERIMENT STATIONS**.

TUMOR. See **CANCER**.

TUNIS. A French protectorate in North Africa lying between Algeria and Tripoli. Capital, Tunis, with 227,519 inhabitants. Total area, 167,400 square kilometers (64,600 square miles); population (1910): 1,706,830 indigenous Arabs, Berbers, Moors, etc.; 49,245 Jews, and about 149,000 Europeans. Population figures are estimates.

PRODUCTION, COMMERCE, ETC. In the mountainous regions are fertile valleys where grazing is carried on; in the lowlands agriculture is practiced and cereals, olives, vines, etc., are grown. In the table on page 728 are shown areas under main crops and yield for two years, with yield per hectare in 1911.

Livestock, December 31, 1911: 39,441 horses, 80,951 donkeys, 13,289 mules and hinnies, 110,707 camels, 191,450 cattle, 686,730 sheep, 468,828 goats, 17,898 swine. The mines yield coal, copper, lead, zinc, and iron.

The 1911 trade follows, with countries of

	Hectares		Quintals		Qs.

Total, 1910	105,497	120,401

Leading exports in 1911—cereals, 46,184,000 francs; phosphates, 38,485,000; lead, 5,705,000; iron, 4,353,000; zinc ore, 4,127,000; esparto, 4,069,000; wine, 3,849,000; olive oil, 3,750,000; woollens, 3,643,000; animals, 3,625,000; fish, 3,168,000; skins, 2,758,000; sponges, 2,695,000.

Railways (1910) 1532 kilometers; extensions are projected. Telegraph lines, 4630 kilometers; wires, 16,004.

FINANCE AND GOVERNMENT. The 1911 budget estimated the revenue at 108,832,148 francs and the expenditure at 108,821,131.

By the treaty of 1881, French control over Tunis is to obtain until the local government is declared by both sides entirely capable of orderly administration. A French resident-general (since 1907, G. F. Alapetite) governs the country under the direction of the foreign office. The reigning bey (1912, Sidi-Mohammed en Nasser) receives an annuity of 940,000 francs; in addition, 750,000 francs are granted to the royal princes.

TUNNELS. Aside from the schemes for municipal subway systems (see RAPID TRANSIT) and the improvement of existing tunnels, but little important work was being undertaken by American railways during the year 1912. On the Pacific Coast active plans were under way still further to eliminate coal burning locomotives where possible and to substitute therefor electricity derived from hydro-electric stations in the mountains, or adjacent power plants. Important tunneling was being carried on in connection with the New York aqueduct (see AQUEDUCTS), especially its distribution system extending under the city of New York and this, both in size and length, represented work quite comparable with a railway structure. Two important pressure tunnels were completed during the year by the United States Reclamation Service. These were the Yama siphon under the Colorado River, 15 feet in diameter and 1000 feet in length, and the Strawberry tunnel in Utah, 19,200 feet in length. The LaSalle street tunnel under the

Chicago River, at Chicago, was opened on July 21. This tunnel is composed of a double tube section of steel, lined with concrete, between bulkheads under the river. These sections were built in the dry dock and towed to position and then sunk and joined. The tunnel was for the Chicago railways. The contract for a subaqueous tunnel connecting Montreal with the south shore of the St. Lawrence and involving four miles of construction, including approaches, was let during the year to Sir John Jackson, Limited. The estimated cost was about \$7,500,000.

JUNGFRAU TUNNEL. On February 21 the tunnel piercing the Mönch and terminating at Jungfraujoch was completed to a point 11,410 feet above sea level. This point, which affords a station for the mountain railway to the summit of the Jungfrau, lies between the two great mountain peaks, the Jungfrau and Mönch, and is 4620 feet above Kleine Scheidegg, the starting point of the railway. The construction of the tunnel involved no serious difficulties and only once did the temperature fall below zero. The material traversed was hard gneiss for the most part with occasional layers of softer granite of a brownish color. In order to secure adequate ventilation and to discharge the spoil from the blasting, a side gallery leading to the southeastern slope of the Mönch at a height of about 11,000 feet was pierced about 1.4 miles from Eismeer station, which hitherto had been the end of the line. This side gallery affords a magnificent view of the mountain. The section from Eismeer to Jungfraujoch was scheduled for 18 minutes' running time and consists of both adhesion and rack railroad, the last 1550 feet before reaching Jungfrau station being operated as a rack road with a gradient of 25 per cent. At the Jungfraujoch station the tunnel was widened into a vast platform from which a shaft 82½ feet long leads to a waiting room with a restaurant and hotel accommodations, while a gallery about 330 feet in length, affords not only a grand view but access to the higher points of the mountains and opportunity for winter sport. No less than six Alpine peaks more than 13,000 feet in height can be reached from this point, which promises to become an important centre for mountain climbers.

The new tunnel through the Cote d'Or mountains in France being driven as a part of the cut-off on the main railway line from Paris to Italy by way of Lausanne, Switzerland, and the Simplon tunnel, received a notable check in its progress on December 23, when an underground river was pierced by the advance heading. The workmen barely escaped with their lives and the flow from the tunnel increased so rapidly that the rivers in the neighborhood were being swollen to a dangerous degree. It was thought at the end of the year that the tunnel might have to be abandoned unless the exhaustion of the source occurred.

The French minister of public works in December, 1912, approved a project for a tunnel between Thillet and Giromagny under the Ballon d'Alsace, a high mountain forming the southern spur of the Vosges, obviating the round-about route to the Est Railway between Epinal and Belfort, and not only shortening the line but developing the Vosges district.

ARTHUR'S PASS TUNNEL. This tunnel, 5½ miles in length, was under construction through

the Southern Alps range to afford access for a new line of the New Zealand government railway in the South Island. The new line will give connection between the east and west sections of the island which are separated by the mountain range and afford access to the coal lands in the province of Westland. Work on the tunnel was commenced in May, 1908, and was to be completed in four years, the contract price being about \$3,000,000. The tunnel is at a height of 2400 feet above sea level or about 600 feet below the level of a pass crossing the mountains, and was being built for a single line track of 3½ feet gauge, the New Zealand government standard. It is 5 miles, 1660 feet long all on tangent with a 3 per cent. grade from the west end to the summit at the east portal. American methods and machinery were used in the excavation which, however, was being carried on by the English bottom heading system. Concrete blocks were being used for the lining on top of sidewalls of concrete. The tunnel is 16 feet, 9 inches in clear height above subgrade and has a maximum width of 15 feet.

TURCO-ITALIAN WAR. INTERNATIONAL DIFFICULTIES. At the beginning of 1912 it was announced that attempts of foreign powers to mediate between Italy and Turkey had all failed. In Italy this was attributed to the obstinacy of Turkey in holding out against the indispensable condition proposed by the Italian government, namely, Italy's absolute sovereignty in Tripoli and Cyrenaica. The German and Austrian press were blamed by Italy for the publication of false news of Turkish successes, which naturally had a marked effect on Turkish public sentiment. On January 17 France was stirred by the report of the seizure of the French mail boat, *Carthage*, and further anger was aroused by the seizure on the following day of another mail steamer, the *Manouba*. The former vessel was taken because it carried an aeroplane consigned to Tunis, which the Italians believed was intended for the use of the Turkish troops in Tripoli. The *Manouba* was stopped because it had on board 29 Turks whom the Italians believed to be army officers. The French government made inquiry into both affairs. As to the *Carthage*, it was released after five days, evidence having been given that the aeroplane would not be placed at the service of the belligerents. As to the *Manouba* affair, on January 26 the Italian government agreed to submit the status of the Turkish prisoners to a French commission of inquiry, which promptly authorized 27 of them to proceed to Tunis and Tripoli. One was seriously ill. One was regarded as doubtful, and not permitted to resume his journey. The questions of law involved in the case were referred to the Hague tribunal.

ENGAGEMENTS ON LAND. Fighting was reported between the Italians and a mixed force of Turks and Arabs on January 18 at the Gargaresh oasis, where the Italians were building redoubts for the protection of the stone quarries. The Italians encountered a severe resistance from the enemy, but succeeded finally in driving them back. The Italian casualties were placed at 50. The loss of the Turks and Arabs was not reported. Some 400 Bedouins made a vigorous attack on a small fort at Bengazi on January 30, but were driven back by the garrison with considerable loss.

On March 3 a fierce attack on the Italian position near Derna was repulsed, and serious losses were inflicted on the enemy. Admiral Aubry, in command of the Mediterranean squadron, died suddenly on March 4, and was succeeded by Admiral Farrabelli.

On March 11 a force of Turks and Arabs attacked Tobruk, but were driven back by banner troops. The Italian losses were given as 12 soldiers and one officer killed, and three officers and 70 soldiers wounded. On the same day seven battalions of infantry with mountain and field batteries attacked a force of the enemy estimated at 6000, and according to Italian accounts inflicted a loss of 1000. The engagement occurred in the two oases that lie to the northeast of Fogat.

NAVAL ACTIONS. On January 1 an Italian squadron engaged a Turkish naval force in the Red Sea and sank seven gunboats. The Italians later bombarded Hodeida. The war entered on a new phase toward the end of February when it was learned that two Italian warships had entered the port of Beirut, and receiving no answer to the demand for the surrender of the Turkish gunboat and torpedo boat, had fired upon them and sunk them. From the time of the action at Preveza at the beginning of the war in October, 1911, the Italians had abstained from activities in Turkish waters and the new turn of affairs was regarded with apprehension in Europe as likely to complicate the situation in the Balkans. On April 16 the powers again addressed the Porte on the subject of mediation. Two days later an Italian squadron of 20 torpedo craft, ironclads, and transports appeared in the Dardanelles and bombarded the forts in the neighborhood of Kun Kalek for a period of two hours, after which the fleet withdrew. On April 23 the Porte replied to the communication from the powers in respect to mediation that it could accept mediation only on the condition that the sovereign rights of Turkey should be maintained and that Tripoli should be evacuated by the Italians. To prevent further Italian depredations in the Dardanelles the Turkish government closed the Straits on April 19, but on May 1 the council of ministers, on the pressing demand of the powers, especially of Russia, decided to open them to navigation until further notice.

SEIZURE OF THE ÆGEAN ISLANDS. On May 4 the Italian forces occupied the island of Rhodes without opposition and captured the Turkish garrison. As a retaliatory measure, the council of ministers at Constantinople resolved on the expulsion of all Italian residents from the vilayet of Smyrna and its dependencies.

By the middle of June twelve of the Ægean islands had been occupied by Italy. Their inhabitants chose delegates to an assembly on the Island of Patmos at which an address was voted to the Italian government saying that the inhabitants desired union with Greece, but if that could not be accorded, they hoped that Italy and the European powers would accord autonomy to all the islands of the Ægean. The Italian press generally held the opinion that it was Italy's right to decide when the islands should be restored to Turkey and pointed out that when under Italian protectorate they had once tasted the blessings of western civilization they ought not to be placed again under the Turkish yoke. During June there were no

military occurrences of importance, and the two powers seemed to be at a deadlock. Italy's seizure of the islands raised the question of the balance of power in the Mediterranean. The British government, taking note of the new posture of affairs, considered the question of strengthening the Mediterranean squadron, which had been diminished to supplement the naval forces in the Atlantic and the North Sea against Germany. The navies of Austria and Italy had greatly increased. The growing power of the Triple Alliance in the Mediterranean threatened to disturb the equilibrium and caused grave anxiety both in England and in France. Certain British journals even began to agitate for the turning of the *entente* between France and England into an offensive and defensive alliance. In July there was much discussion of a possible diplomatic solution of the question between Italy and Turkey, the long-protracted war having led to no decisive result.

PEACE NEGOTIATIONS AND THE END OF THE WAR. In the latter part of August officially recognized representatives of Italy and Turkey engaged in pourparlers for the restoration of peace. The meetings were held at Ouchy, Switzerland. The chief difficulty arose from Italy's decree of annexation (November 5, 1911) which Turkey was unwilling to accept. The Italian government, on the other hand, declared it could not recall its decision. Nevertheless it expressed its willingness to accept Turkey's mere recognition of the fact and to concede to the Sultan as the religious head of Islam a nominal and spiritual authority over the Moslems in Tripoli. It was understood from the beginning that Italy had no intention of exacting the payment of a war indemnity. The Italian envoys were the Hon. Pietro Bertolini, the Hon. Guido Fusinato, and Commander Giuseppe Volpi; the Turkish were Naby Bey and Fahr-ed-din Bey, who were afterwards joined by Reshid Pasha, the former ambassador to Rome. Finally the plenipotentiaries agreed on a formula that avoided the difficulty in regard to Turkish recognition of annexation. It provided for the autonomy of the provinces without requiring the express recognition by Turkey.

While the negotiations were pending the war in Tripoli was still going on and the prospects of peace were not definitely assured till the war in the Balkans made further Turkish resistance in the Tripolitaine hopeless. On July 8 the Italians captured the town of Misurata to the east of Tripoli, completely routing the enemy according to Italian official reports and suffering a loss of 9 killed and 121 wounded. On the night of July 18 a squadron of Italian torpedo-boats succeeded in penetrating into the Dardanelles though their position was revealed by searchlights and they were subjected to a heavy fire. After reconnoitring the straits they effected their escape, sustaining only slight damage. On September 17 fighting took place at Derna, where, after an eight-hour engagement, the Italians, according to their own report, defeated the enemy, inflicting a loss of 1000 killed and many wounded. Their own losses were placed at 61 killed and 113 wounded.

TREATY OF LAUSANNE. On October 15 on the receipt of the joint note from Bulgaria, Servia, and Greece, Turkey immediately agreed on the terms of peace, and on the evening of that day

the plenipotentiaries at Ouchy signed the preliminaries. The terms were as follows:

1. Italy maintains absolutely the decree in which she declared her full sovereignty over Libya, i. e., the Tripolitaine and Cyrenaica.

2. Italy does not require Turkey to recognize expressly the annexation—and thus transgress the letter of the Koran, which forbids the cession to the infidel of lands belonging to the Caliph.

3. Turkey engages to recall her troops, to cease supplying the Arabs with munitions of war and money. In return Italy offers pardon to all the Arabs who are willing to submit, though she will treat as rebels those who do not lay down their arms.

4. Italy engages to restore to Turkey the Ægean Islands occupied by her troops, but on the condition that a general amnesty shall be granted to their inhabitants, that local autonomy be respected, and that public liberty be guaranteed.

If Turkey fails to fulfill these conditions, Italy reserves to herself the right of taking action against her, and the islands are not to be restored until the agreement respecting them is loyally carried out.

5. Italy accepts a clause like that in the Austro-Hungarian treaty in regard to Bosnia-Herzegovina, recognizing the religious authority of the Caliph in the Tripolitaine, but expressly excluding any sort of political authority.

6. No war indemnity is required by either belligerent. Italy engages, however, to pay that portion of the Ottoman public debt which is guaranteed by the revenues of the Tripolitaine and Cyrenaica.

7. The diplomatic and commercial relations between the two countries shall be restored to the same status as before the war.

TURKEY. The TURKISH or OTTOMAN EMPIRE is an absolute monarchy, with possessions in southeastern Europe, southwestern Asia, and northeastern Africa (Egypt). Capital, Constantinople.

AREA AND POPULATION. At the end of 1912, with Tripoli definitely surrendered to Italy and much of her European territory occupied by the armies of the Balkan allies, it would be idle to attempt a calculation of Turkey's actual area and population. If, with the sanction of the great powers, the Balkan allies succeed in making good their threat to drive Turkey out of Europe, and Great Britain makes a protectorate of Egypt, the area of the empire will be less than 900,000 square miles and its population under eighteen millions. The table on the next page gives area in square kilometers, estimated population, and density per square kilometer, by vilayets and (six) mutessarifats (marked *) at the outbreak of the Balkan War and exclusive of Tripoli and Bengazi.

Total Turkey in Europe, 169,300 square kilometers (65,367 square miles) and 6,130,200 inhabitants; Asia Minor, 501,400 (193,591) and 9,089,200; Armenia and Kurdistan, 186,500 (72,008) and 2,470,900; Syria and Mesopotamia, 637,800 (246,255) and 4,288,600; Arabia, 441,100 (170,309) and 1,050,000. Asir, Nejd, and El Hasa and El Katr, in Arabia, are regarded as belonging to Turkey, but are inhabited by tribes whose subjection is merely nominal. Anatolia is another name for Asia Minor; the name Albania is given to an indeterminate

area embracing the vilayets of Scutari and Janina with portions of Kosovo and Monastir; Macedonia comprehends the vilayet of Salonika, the eastern (and larger) part of Monastir, and southeastern Kosovo. The Turks are estimated to number about 11,000,000; Greeks, Arabs, Albanians, Bulgarians, Servians, Vlachs, Kurds, Armenians, Jews, Syrians, Circassians, and other races are scattered over the empire. Reliable population figures are unobtainable—the eleven million Turks being merely a guess. In a country so disorganized not much attention has been paid to the compilation of accurate statistics; foreign statisticians have attempted numerous calculations, which all disagree. Mohammedans form the majority of the population. Christians (Orthodox Greek) predominate in some districts, notably in Macedonia, and Gregorians in Armenia. There are also Roman Catholics, Jews, Nestorians, etc.

Public education, in the Western sense, is almost unknown, except in non-Moslem institutions, which are not as a rule interfered with. Moslem instruction, theoretically obligatory and in all cases free, is confined mainly to the reading of the Koran and is largely in the hands of the priests.

In the following list of principal cities a reliable authority is quoted for population figures. No accurate official census having been taken, they must be regarded as estimates. Population of Constantinople, 942,900 (1,200,000 with suburbs); of Salonika, 144,200; Adrianople, 123,000; Pristend, 60,000; Monastir, 60,000; Serres, 32,000; Scutari (Albania), 30,000—all in Europe. Population of Damascus, 250,000; Smyrna, 250,000; Aleppo, 200,000; Beirut, 140,000; Bagdad, 125,000; Erzerum, 120,000; Jerusalem, 84,000; Brussa, 80,000;

Mosul, 80,000; Sivas, 78,000; Mecca, 70,000; Basra, 60,000; Trebizond, 60,000; Adana, 50,000; Homs, 50,000.

PRODUCTION. Following are the statistics of production (1910) in "29 provinces and districts": 44,845,000 quintals of wheat, 4,773,000 of rye, 29,005,000 of barley, 4,478,000 of oats, 11,246,000 of corn, 1,019,000 of rice. Cotton, tobacco, opium, and other crops are raised; olive oil, wool, and mohair are valuable exports; rugs are manufactured. There are rich mineral deposits which are not worked, and fertile tracts through which no railroads run. The labor problem is acute in Turkey.

COMMERCE. Trade statistics are incomplete. A reliable German source gives the following as the trade by countries of origin and destination for the year ended February 28, 1911, in thousands of pounds Turkish (£Tl = \$4.40):

	Imps.	Exps.		Imps.	Exps.
U. K.	8,480	5,370	Rumania ..	1,070	529
Aus.-Hun. .	7,653	2,194	Netherlands	822	334
France	3,930	4,403	Persia	691	446
Germany ...	3,897	1,810	U. S.	648	1,009
Italy	3,649	1,480	Servia	463	304
Russia	2,798	912	Greece	250	382
Bulgaria ...	2,003	797	Other	1,434	158
Brit. Ind. ...	1,937	255			
Belgium ...	1,670	614	Total	42,556	22,080
Egypt	1,164	1,584	1909-10. .	33,283	18,199

In thousands of pounds Turkish are given import and export values for the year 1909-10, showing great classes: Agricultural and forest products, including animals, foodstuffs, and beverages, 12,388 imports and 7865 exports; textiles and raw materials, 12,012 and 5525; hides and leather, 936 and 779; machinery and vehicles, 782 and 6; paper and books, 683 and 54; stone, pottery, and glassware, 683 and 29; articles of luxury, 466 and 28; minerals, including petroleum, 2961 and 743; drugs, chemicals, etc., 1662 and 2435; rubber manufactures, 142 and 1; other merchandise, 567 and 732.

Vessels entered (1910) at the port of Constantinople, 20,268, of 19,153,951 tons, of which 11,684 steamers, of 18,554,116 tons; at Smyrna, 6655, of 2,477,733 tons, of which 2661 steamers, of 2,400,333 tons. The merchant marine included (1911) 120 steamers (66,878 tons) and 963 sailing (205,641).

COMMUNICATIONS. Railways 1910: 1994 kilometers in European Turkey, 2372 in Asia Minor, 2294 in Syria and Arabia; a total of 6660 kilometers, or 4138 miles. Reported in 1912 to be 4230 miles, divided as to ownership as follows: Hejaz line (1000 miles), Turkish; Salonika-Constantinople (320), Smyrna-Kassaba (330), Syrian (370), Jaffa-Jerusalem (60)—all French lines; Salonika-Monastir (140), Anatolian (to Angora, 360; to Konia, 300; to Adabazar 50), Bagdad-Bulgurlu (130), Mersina-Adana (50)—all German; Oriental railways (800), Austro-German; Smyrna-Aidin (320), British. The line which runs from Smyrna via Aidin to Dinar had in hand the Egerdir extension, but it was reported that war had interfered with its progress. On the Bagdad Railway, the laying of rails for the section east of Aleppo began in February, 1912, and the section from Konia to Kishla, a distance of 150 miles, had been opened. Later this was extended ninety miles from Dorak to Marmoret, though between these sections there

are twenty miles of very difficult work which was in progress. Previous to the outbreak of the war a line from Derven to Gidu was also in course of construction.

Telegraph lines (1910), 45,466 kilometers; wires, 76,738; stations, 1202. Post offices (1910-11), 929.

FINANCE. The 1912-13 budget is given below in detail:

Revenue	£T	Expenditure	£T
Direct taxes....	14,870,381	Public debt †..	14,709,937
Ind. taxes.....	5,692,728	War	8,948,705
Monopolies	3,621,373	Administrat. ‡	4,166,053
Stamps, etc....	1,361,886	Justice, etc. §	1,690,104
Pensions	1,178,513	Pub. works....	1,217,521
Tribute *	893,877	Marine	1,276,000
Various	1,724,770	Posts & tels... †	732,800
		For. affairs §	678,833
		Civil list.....	505,880
		Sheikh-ul-Islam	19,170
Total	30,514,159		
		Total	34,590,561

* Egypt, Cyprus, Mount Athos, Samos. † And finance. ‡ Senate, Chamber, council, gendarmerie, court of accounts, etc. § And worship and instruction. § And agriculture, mines, and forests.

The public debt stood, September 24, 1912, at £T118,745,378. The piaster, worth about 4.4 cents, is the unit of value, 100 piasters being equal to one pound Turkish.

ARMY. The Turkish army at the beginning of 1912 was organized on the basis of obligatory service, the divisions and terms of service being as follows:

Active army (nizam), 3-4 years; reserve (ikhtiat), 5-6 years; landwehr (redif), 9 years; and mustafiz (territorial reserve), 2 years. The reserve training was very perfunctory, but the redif formations were frequently called into service at times of domestic disorders. The numerical strength of the entire army either on a peace or war basis in 1912 would be more or less a matter of conjecture, but its organization and distribution at the beginning of the year are indicated below, while under MILITARY PROGRESS and TURKEY AND THE BALKAN PEOPLES, its activity and service are described.

The reorganization of the Turkish army under Izzet Pasha, which had begun in 1911, involved the adoption of the 33-battalion organization with three regiments and a machine-gun company to a division, three divisions (with corps troops) to an army corps, etc. There was also in process of formation a field army composed exclusively of nizam elements, with proper complements of fortress and coast-defense troops, and separate redif divisions were also planned, modeled upon those of the nizam army. This reorganization was still in progress in 1912 and was given the test of war, though in fact the theoretical organization and grouping were broken up even before the outbreak of actual hostilities in the Balkans. Both officers and recruits in many cases were new to their work in the nizam, while in the redif formations there was a lack of commissioned officers.

Class 1 of the redif consisted of men who had completed their time with the nizam and class 2 consisted of all troops not serving with the nizam, class 1 of the redif, or the mustafiz.

The total theoretical strength of the Turkish infantry was as follows: 79 nizam regiments of four battalions of four companies each; 20 sep-

arate chasseur battalions of four companies; 4 special chasseur battalions (on Bulgarian frontier), or a total of 340 battalions in the first line.

In the second line were 96 redif regiments, class 1, of four battalions each, or a total of 384 battalions. The projected strength of redif class 2 was: 172 regiments of four battalions each, or a total of 688 battalions. This class was reported as completed in Turkey in Europe at 40 regiments of four battalions each—a total of 160 battalions.

The Turks claimed a total war strength of infantry battalions as follows:

Special chasseurs, 26 officers, 800 men, 650 rifles. Nizam, 24 officers, 700 men, 650 rifles. Redif, 1st, 24 officers, 900 men, 850 rifles. Redif, 2d, 24 officers, 800 men, 750 rifles. Mustafiz, 8 to 15 officers, 400 to 600 men, 400 to 600 rifles.

The above would give a grand total of: Officers, 37,008; men, 1,222,200; rifles, 1,158,600.

The infantry was armed with the Mauser rifle as a rule (models 1887-1890), of which 1,120,000 were issued or in store, with 510,000 Martini-Henry rifles in reserve.

The Turkish cavalry consisted of the "Cavalry of the Guard"—one regiment ertogrul, two of hussars, and one of lancers, and 38 regiments nizam, all of 5 squadrons each, or 190 squadrons in all, and 12 regiments redif of 4 squadrons each, or 48 squadrons. The redif cavalry was attached to the first three army corps or "ordus." On a war basis a squadron would number 6 officers, 100 men, 80 horses (ertogrul, 140 men, 135 horses). The nizam cavalry was incorporated with the first six ordus, one division of three brigades of two regiments each being appointed to each ordu. The total war strength was 54 regiments (210 squadrons); 1580 officers, 26,800 men, 21,900 horses. The cavalry was armed with repeating carbines and sabers.

The Turkish artillery was all nizam, there being no second line.

Military reports current in 1912 gave the total strength of the artillery at 198 field-batteries (1188 guns), 18 horse-batteries (108 guns), 40 mountain batteries (240 guns), and 12 howitzer batteries (72 guns); total, 268 batteries (1608 guns). These were all of various Krupp types. The ammunition train counted 1254 wagons. On a war footing the strength of the artillery was 1032 officers and 29,380 men.

Technical troops were organized into battalions of railway and telegraph troops, sappers, and miners, etc.; in all 11 battalions (55 companies), numbering 245 officers and 10,470 men. Other non-combatant troops as medical corps, military train, etc., were undergoing reorganization before the outbreak of the war. Colonel Brose, late of the information department of the German general staff, estimated the number available for war as 600,000 of all arms, and this estimate was considered liberal by military men. For other notes on the army of Turkey see MILITARY PROGRESS.

NAVY. No reliable figures can be quoted for the number and displacement of vessels composing the Turkish navy at the end of 1912, the exact damage sustained during the Balkan War being unascertainable. In April, 1912, Rear-Admiral H. P. Williams was succeeded

NICHOLAS I.
King of Montenegro

FERDINAND I.
Czar of the Bulgars

GEORGE I.
King of Greece

PETER KARAGEORGEVITCH
King of Serbia

FOUR RULERS OF THE BALKAN STATES

1901

as naval adviser to the government by Rear-Admiral A. H. Limpus. The British foreign secretary has declared that British naval officers now in the service of Turkey will not be recalled so long as they refrain from active engagement in hostilities.

GOVERNMENT. Both temporal and spiritual authority rest with the sultan, who appoints a grand vizier to form a cabinet. A senate and a chamber of deputies constitute the legislative body. At the head of ecclesiastical affairs is the Sheikh-ul-Islam, under the direction of the sultan. Reigning sovereign (1912), Mohammed V., born 1844, brother of the deposed Abdul Hamid, whom he succeeded April 27, 1909.

In July, 1912, the minister of war, Mohammed Shevket Pasha, having been severely criticised for harsh measures in Albania, resigned; and with him resigned also the minister of marine. Unable to fill the vacancies, Saïd Pasha followed suit. Upon the refusal of Tewfik Pasha to head a new ministry, Ghazi Ahmed Mukhtar Pasha was prevailed upon to accept the post. On the twenty-ninth of October he resigned and the aged Kiamil Pasha became grand vizier. See below under *History*.

HISTORY

INTRODUCTION. The chief interest in Turkey during 1912 centred in the Balkan War and the events that led up to it and in the Turco-Italian War. These subjects are discussed under the titles of **TURKEY AND THE BALKAN PEOPLES** and **TURCO-ITALIAN WAR**. The present article deals only with the internal affairs of the empire.

DISSOLUTION OF PARLIAMENT. On December 30, 1911, as narrated in the last **YEAR BOOK**, the cabinet resigned on account of party differences, but a few days later (January 3, 1912) Saïd Pasha was reappointed premier and the cabinet was reconstituted with only a few changes. The point at issue was an amendment to the constitution which empowered the sultan to dissolve the Chamber in war time without the consent of the Senate. The opposition to the representatives of the committee of union and progress had steadily increased and before the end of 1911 a parliamentary coalition, under the name of the Union and Liberty party, had been formed against it. The new party regarded the proposed constitutional amendment as a manœuvre of the government to bring about the dissolution of Parliament and order the elections at a time advantageous to itself. The measure failed of the requisite two-thirds majority. Under the new cabinet it was reintroduced on January 13, but was again rejected. Parliament was dissolved nevertheless, the Senate giving its consent apparently for fear lest the government would otherwise secure the required majority by the creation of new senators. Thus terminated the first session of the Turkish Parliament under the constitutional régime (January 18).

THE ELECTIONS. The results of the elections, which became known in April, were a clean sweep for the committee of union and progress. Despite the severe criticism of the committee for its blunders and even crimes, the people took little interest. The government was accused of intimidation and of threatening officials

with dismissal if they voted against it, of striking names of hostile voters off the registers, etc. Places known to be centres of opposition voted for the government nevertheless. Opposition papers were suppressed. Gerrymandering, suppression of free speech, etc., were common. But the chief reason for the victory was the fact that the committee of union and progress was organized and the opposition was not. The opposition was completely blotted out, while the committee of union and progress seemed stronger than ever.

The chief criticism of the committee of union and progress was directed against its course in the Hauran, in Yemen, and especially in Macedonia and Albania. It was blamed for its ruthless policy of Ottomanizing the empire, which had raised up enemies on all sides. Macedonia was declared to be in a worse condition than it had been in under Abdul Hamid. On the other hand, it was urged on behalf of the committee that under its administration the country had been allowed to develop, the army strengthened, the roads made secure, and the finances brought into some sort of order.

MACEDONIA AND ALBANIA. There were many signs of disturbance in Macedonia at the beginning of the year. At the close of 1911 the Bulgarian revolutionary body known as the "Internal Organization" was revived on the ground that conditions in Macedonia were as bad as they had been under the Hamidian régime. The massacre of Bulgarians at Ishtib in December, 1911, and the slowness of the authorities in bringing the culprits to justice led to savage reprisals. A similar outrage took place at Kotchana in August and again the authorities delayed in punishing the murderers. Almost at the same time another massacre was reported at Berane on the Montenegrin frontier. Meanwhile the long-threatened revolt in Albania had broken out in May and the government was further embarrassed by a mutiny of its own troops on June 22. Since these were among the events which led to the Balkan War they will be discussed further in the article on **TURKEY AND THE BALKAN PEOPLES**, paragraphs on *Macedonia and Albania*.

POLITICAL CRISES. The hostility between the Military League and the committee of union and progress continued. The announcement by the new ministry of its policy on July 30 responded to the demands of the league in promising to dissolve the recently elected Chamber. The hostility to the Young Turk party in certain quarters has been frequently mentioned in previous **YEAR BOOKS**. Their organ, the committee of union and progress, with headquarters at Salonika, had become the real, though secret source of all authority, the power behind the government. But the committee's power in turn rested on the army, whose officers during the past four years had, in spite of the government's efforts to prevent it, concerned themselves with political affairs. Disensions developed in military circles and a group of officers opposed the minister of war, Mahmud Shevket Pasha, and prominent members of the committee. These attacks led finally to the resignation of the committee and of the minister of war. The occasion closely resembled the beginning of the revolution in 1908. Now, as then, there was a serious outbreak in Albania and a military mutiny in

Macedonia. It was soon found that the dissatisfaction among the troops was not confined to Macedonia, but extended to other parts of the empire. The grounds of this discontent were not easy to determine. Some officers accused the authorities of leaving Tripoli without defense. The war minister, Mahmud Shevket Pasha, was blamed for arbitrary conduct. He resigned on July 9, giving as his reason that "having lately caused a law to be voted forbidding army officers to engage in politics, he judged it more expedient and wise to leave to another the task of applying that law." Little importance was attached to this declaration since military officers had constantly participated in political discussion and election contests for four years past. The only difference now was that they were against the policy of Mahmud Shevket instead of for it. This was followed by the fall of the Sâid ministry on July 17. Two days later the sultan addressed the army, reminding it of its oath of allegiance to the constitution. On July 22 a new cabinet was formed under Ghazi Muktar Pasha, a well-known general of the Russo-Turkish War, with Kiamil Pasha as foreign minister.

On August 5 the Muktar Pasha ministry pronounced the dissolution of the Chamber. Meanwhile the committee of union and progress had endeavored to organize a movement of resistance and for the moment there was fear of conflict, but the army did not support them, even the garrison of Salonika siding with the government. There was much dissension and the internal situation was very critical while the danger from outside gathered. The cabinet itself was divided, the majority demanding the dismissal of the committee of union and progress and the governors of the provinces, while the grand vizier and Hilmi Pasha opposed this and urged a conciliatory policy. The latter resigned, as did his opponent, Zia Pasha. Many partisans of the committee of union and progress were dismissed from office. Army officers were forbidden to take part in politics.

On October 29, Ghazi Muktar Pasha resigned and was succeeded on the following day by Kiamil Pasha, who for the fifth time formed a cabinet. He retained a number of the old ministers, including Nazim Pasha, minister of war.

THE BAGDAD RAILWAY. Work on the section of the Bagdad Railway eastward from Aleppô was begun on February 10. Negotiations between Turkey and Great Britain concerning the construction of the Persian section of the Bagdad Railway were discussed in March and it was arranged that they should be conducted in London. The main question was whether the British government should consent to the increase of the Turkish customs desired by the Turkish government. The purpose of the British government was to reach an understanding with Turkey as to the status of questions concerning the Persian Gulf. It was expected in 1912 that the rail head would reach Bagdad by 1918. On October 31 Sir Edward Grey announced in Parliament that the sections from Konia to Kishla and from Dorak to Mamouret were already open to traffic.

OTHER EVENTS. On July 10, 1911, Zeki Bey, chief secretary of the Public Debt Administration, was shot and killed. He had been an active journalist and foremost in attacking

the policy of the committee party, and his murder was attributed to political reasons. In the latter part of May, 1912, the High Court of Constantinople sentenced to fifteen years' imprisonment at hard labor the two persons accused of the crime. On June 3 a fire broke out in Stamboul, destroying over a thousand houses and public buildings. On August 9 a disastrous earthquake occurred on the shores of the Dardanelles and the Sea of Marmora, destroying many towns and villages. The loss of life was estimated at 3000; some 6000 persons were injured, and 40,000 rendered homeless.

For other notes on Turkey, see **ARBITRATION, INDUSTRIAL; EARTHQUAKES**, and for recent books on Turkey, see **LITERATURE, ENGLISH AND AMERICAN, Travel and Contemporary History**.

TURKEY AND THE BALKAN PEOPLES. On September 30, 1912, came the news that Bulgaria, Servia, Montenegro, and Greece were mobilizing their troops with great rapidity and that unless the great powers took strong measures to prevent it war was inevitable. Some crisis of this sort in the Balkans had been predicted on the outbreak of the Turco-Italian War and signs of its approach were manifest in the summer and early autumn months. A review of the situation will be given here. For supplementary information, see **TURCO-ITALIAN WAR, TURKEY, GREECE, CRETE, BULGARIA, AUSTRIA-HUNGARY, and MILITARY PROGRESS**.

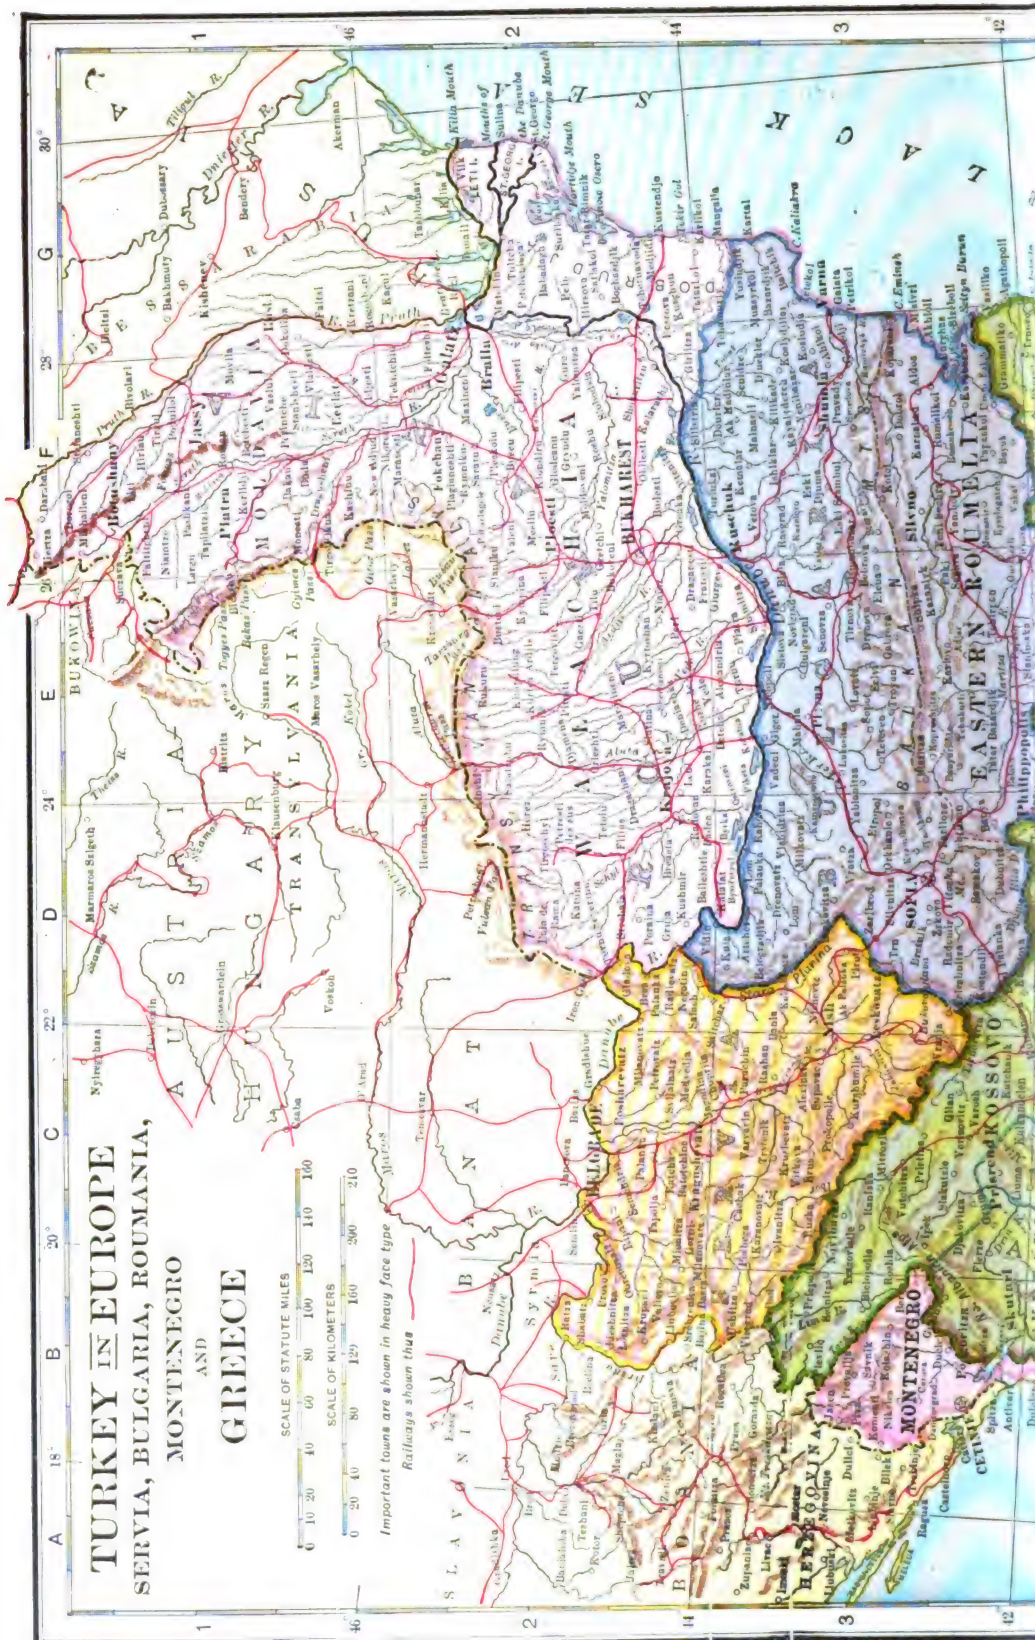

The immediate causes of the crisis were the Albanian revolt and the irregular fighting in Macedonia and Thessaly and on the borders of Servia, Bulgaria, and Montenegro. But since conditions in Macedonia and Albania had been for many years preparing for this event, it is necessary to review them briefly. The following paragraphs outline the course of events in these parts of the empire down to the final outbreak of war in October, 1912.

MACEDONIAN REFORMS. Macedonia was ceded by Turkey to Bulgaria in 1878 pursuant to the treaty of San Stefano, but the Congress of Berlin in the same year revised this treaty and through the insistence of Great Britain and Austria restored the province to Turkey. In Article XXIII. of the treaty of Berlin, however, the signatory powers bound themselves to establish an organic law providing for good government in Macedonia and to see that it was applied. During the thirty-four years that followed this promise was unfulfilled, despite the frequent complaints of the Christian peoples—Bulgars, Greeks, and Serbs—of Turkish misgovernment and atrocities. It was only when the Balkan states constituted themselves protectors of Macedonia and threatened war against Turkey that the powers began to act in the matter. At the end of 1902 Austria and Russia, in view of the increasing disorder in Macedonia, demanded of Turkey a moderate plan of reform, while they urged Servia, Bulgaria, and Greece to observe patience and self-restraint. With an inspector-general appointed by the sultan were associated two civil agents, one a Russian and the other an Austrian. This was the first measure of reform. Europe was at least represented in the Macedonian administration. The other powers, especially France and England, next obliged the Porte to accept other foreign agents with special functions—namely, four financial advisers and thirty-six officers whose duty it was to reorganize the Ottoman gendarmerie in Macedonia. Thus Eu-

European powers gained the right of supervision in the three important departments of the gendarmerie, the finances, and the civil administration, but the system was incomplete and there was little harmony between the powers. Germany wished to meddle as little as possible with the administration of a Turkish province. England, on the other hand, supported by Russia, wished to go further, following the logic of the situation. It was argued that there could not be a reform of the gendarmerie without a reform of justice, that financial reforms called for administrative reforms, etc. Accordingly, in 1907 the British ministry proposed a new plan, including the reorganization of justice under the direction of European agents, and King Edward VII. and the czar met at Reval with their respective foreign ministers and agreed on a thorough programme of reforms.

MACEDONIA UNDER THE YOUNG TURKS. Then came the Young Turk revolution of 1908, which, having the principles of equality and liberty before the law as its basis, promised to bring about the reforms of itself. The European powers believed in the good faith of the Young Turks and in their ability to remove the Macedonian abuses. This confidence was shared by the subject races of Macedonia themselves. Bands of Bulgars, Serbs, and Greeks laid down their arms and fraternized with the Turks. But these hopes were short-lived. It soon became evident that the Young Turk revolution was directed not only against the tyranny of the Hamidian régime, but against its feeble foreign policy, which permitted the powers to interfere in the internal affairs of the empire. The revolution aimed at nationalization and centralization quite as much as at liberalism. It has been said in fact that the meeting at Reval itself was the immediate occasion of the revolution, so adverse were the Young Turks to foreign intervention in Macedonia.

The elections immediately following the revolution proved that the Young Turks had no intention of carrying out the policy of equality for the different races and confessions. The programme of the committee of union and progress pronounced Turkish the official language and declared that education must be uniform for all citizens. The policy of "Turkification" was made clear from the first. Still, it was hoped that eventually matters would mend, and the powers agreed to the request of the new government that they give up their policy of reform. The Christians of Macedonia continued loyal to the revolutionary movement and on the attempted counter-revolution in 1909 they were among the first to march on Constantinople. After the fall of Abdul Hamid and the accession of Mohammed V. the way was open to the reconciliation of the alien races in the empire, but the Young Turk party did not improve the opportunity. On the contrary they insisted rigidly on that policy of centralization and assimilation which has kept the empire in a state of ferment during the last four years. While requiring Christians to serve in the army they excluded them from civil functions. The disarmament of the Christian population was the occasion of worse atrocities than in the time of Abdul Hamid. Many concealed their weapons and armed bands began to appear in the country as before. The Christians were further incensed by the policy of planting Moslem colonies in Macedonia, with a view to re-

adjusting the balance of the population in favor of the Turks. The constitutional privileges accorded to the subject races were curtailed. Public meetings were forbidden. The constitutional clubs were suppressed. The effect of this was to drive the malcontents to the use of lawless methods. The execution of native chieftains who had returned to their homes, relying upon the promise of amnesty, added to the discontent. At the end of the first year under the new régime conditions in Macedonia were said to be nearly as bad as they were under Abdul Hamid. In general, the discontent in Macedonia, as elsewhere, arose from the efforts of the Young Turks to efface national distinctions and abolish local privileges, pursuant to their policy of Ottomanizing the empire. In Macedonia, where race feelings are strong, this had the effect of driving the people into secret rebellion. Lawless bands infested the country. Political assassinations were common. The repressive measures of the Turks served only to bring new recruits to the outlaws. The Bulgarian "Internal Organization" was revived in the autumn of 1911 and continued its revolutionary activities during 1912. Its aim was Macedonian autonomy through international intervention. Among the various features of Turkish misrule as reported in the press during the last three years are the following: The suppression of the political liberties promised by the new régime; the disarmament of the natives in 1910 in circumstances of great brutality; the inhuman extension of the punishment for brigandage to the families and friends of the insurgents; the harrying of the country by lawless bands under the auspices of the committee; the colonizing of Christian districts by Moslem immigrants; and the violent or corrupt methods employed in the last election of April, 1912. (See *TURKEY, History*.) A very significant effect of these mistakes was to draw the nationalities together in a common hatred of the Turks. From 1902 to 1908 the Serb, Bulgar, and Greek bands were as likely to massacre one another as to massacre Turks. Now they laid aside their rivalries. By the close of 1910 the Bulgars and Greeks in Macedonia who had long been the bitterest and most active in their hostility became fully reconciled, and this was followed by close and friendly relations between the governments of Bulgaria and Greece. During 1912 events occurred which further angered the Balkan states and drew them together in a common policy against Turkey.

THE KOTCHANA MASSACRE. While crowds were gathered in the market-place of Kotchana in August a bomb was suddenly exploded and another explosion followed within fifteen minutes. Attributing the outrage to the Bulgars the Turks attacked and killed a large number of them and arrested many more. The incident greatly excited the Bulgars on both sides of the frontier and there were many popular demonstrations on behalf of immediate war with Turkey for the liberation of Macedonia from the Turk. The Bulgars asserted that the bomb-throwers were not of their race and accused the Turks of having instigated the crime. An official investigation was at once begun. According to some accounts of the affair, the bomb explosions were followed immediately by a rush of 200 Turkish troops from the garrison who fired into the crowd, and then fell upon

them, bayoneting them or clubbing them to death. Later the soldiers went to the houses of Bulgars and arrested all whom they could find. The official inquiry established the guilt of several officers, many of the garrison troops, and some of the civil officials. Orders were given that the accused should be tried by court-martial. The authorities, however, did not bring any of the guilty persons to justice and their delay greatly intensified ill-feeling in Bulgaria, where the memory of the massacre of Ishtib in December, 1911, was still fresh. See *TURKEY, History*.

At about the same time as the Kotchana atrocity, a massacre of Christians by Turkish soldiers was reported at Berane on the Montenegrin frontier.

THE ALBANIAN DIFFICULTY. Similar results followed the government's treatment of the Albanians, who had been the hereditary allies of Turkey and her main support in the Balkan peninsula. On four occasions they rose in revolt. The uprisings of 1910 and 1911 were not put down till armies of 60,000 to 70,000 took the field. The Albanians were incensed by the government requirements that the Arabic should be used instead of the Latin alphabet and still more by the flogging of some of their chiefs at the time of the disarmament in 1910. For their loyalty to the sultan they had long enjoyed the right of bearing arms. The attempt to deprive them of it caused them to revolt and the excesses of the Turkish soldiery under Torgut Pasha left them in a vengeful temper. In the campaigns of 1911 Montenegrin irregulars fought on the side of the Albanians against the Turks. The policy of the government brought about a reconciliation between the Albanians of the north with both Montenegrins and Serbs.

The influence of Montenegro in northern Albania continued to be paramount. It was said that King Nicholas resorted to every means to retain his influence over the Malissori and that Montenegrin agents were active throughout northern Albania. In Macedonia the Bulgarians and Greeks formed a compact to join forces in the coming elections against the Young Turk party. The long expected disturbances began to assume serious character in the latter part of May, 1912. There had already been signs of insurrection and as these grew more serious the Turkish forces were increased to thirty battalions in northern Albania. In the latter part of May the Albanian demands were set forth in a memorandum to the great powers and to the Turkish authorities. They included the fixing of the boundaries of Albania, the recognition of its flag, the appointment of a governor-general from the old ruling family of Albania, the appointment of Albanians in place of the Turkish-speaking officials, the adoption of Albanian as the official language, and the guarantee of these reforms by the great powers. Early in August the Albanians submitted their programme of reform to the Turkish government. It included: A special system of administration of justice; Albanian military service in time of peace to be confined to the European vilayets; civil functionaries to employ the national language; the establishment of agricultural schools; an increased number of schools for science and religion; the teaching of the several languages in the schools; road-making and railway building; the unre-

stricted right to create private schools; the impeachment of the Hakkı Pasha and Said Pasha cabinets; a general amnesty and restitution of arms. It was announced soon afterwards that the government accepted this programme except as it regarded the impeachment of ministers and the restoration of arms. On the latter point they offered as a compromise to arm the people on the frontiers and the shepherds and forest workers. The government dispatched a mission to inquire into the Albanian grievances. It was announced on August 20 that the Albanian chiefs, assembled at Prishtina, had accepted the government's terms, that the malcontents were returning to their homes, and that the country was virtually pacified. In the early part of September, however, fighting with the Malissori was reported and both that tribe and the Mirdites were said to be preparing for a general uprising.

MUTINY IN ALBANIA. On June 25 came the news of the mutiny of the officers and men in a battalion of the 49th Regiment at Monastir. Reports of disaffection among the troops of the Monastir army corps had been circulated for some time past, and this was attributed largely to growing hostility to the régime of the committee of union and progress. The deserters, seizing such ammunition and supplies as they could find, repaired to the hills near the spot where four years before the revolt of a small body of soldiers against the Hamidian despotism had marked the beginning of the Young Turk revolution. Simultaneously with this news came the report of a new outbreak in western Albania, where the Malissori had again taken up arms. Within a few days additional desertions were announced and it became evident that the disaffection had spread widely among the troops. Dispatches were censored, but the demands of the mutineers were said to include the resignation of the ministry, the cessation of the committee's interference with the executive, and the impeachment of certain members of the cabinet. The government hurried a large body of reinforcements into the region, but did not proceed vigorously against the mutineers. On July 9 the experienced and able minister of war, Mahmud Shevket Pasha, resigned from the cabinet. This was followed on July 17 by the resignation of the grand vizier, Said Pasha, and the entire cabinet, in spite of a nearly unanimous vote of confidence from the Chamber two days before. See *TURKEY, History*.

INTERNATIONAL ASPECTS. Behind the immediate issues between Turkey and her Christian populations and their natural protectors, the Balkan states, was the play of greater European forces, arising from racial and national ambitions. On the one hand was the Pan-Slavist movement, and Russia's dream of a union of the Balkan Slavs with Greece, which would give her access to the southeastern ports. On the other, was Austria's desire to preserve the *status quo*, which was attributed to her hope of eventually gaining more Slav territory to be united with her own Slavic dominions. Count Berchtold, who succeeded Count Von Aehrenthal as foreign minister in February, 1912, began at once to work for peace on a basis favorable to the whole to Turkey. He proposed that the war between Italy and Turkey should cease on the understanding that while Italy should retain the occupied territory in

U of M

1700

north Africa, Turkey was to be in a stronger position than ever in Europe and the Levant. Turkey, which was passing through a political crisis, did not accept this solution and it provoked resentment in the Balkans, where it was regarded as too much in the Ottoman interest, and in Greece, where the fear of a return of the twelve Ægean Islands to Turkey caused public demonstrations in protest. Russia on this occasion showed her sympathy with Italy. Nevertheless there were signs of improved relations between Russia and Austria-Hungary early in the year, and the new Russian foreign minister, M. Sazonoff, in a speech in the Duma in April, declared the two governments agreed on the following principles: The maintenance of the *status quo* in the Balkans, the independence and peaceful development of the Balkan states, and the support of the new régime in Turkey. In August Count Berchtold endeavored to unite the European governments in a policy that should secure peace and the maintenance of the *status quo* in the Balkans. He invited the powers to cooperate in encouraging the Ottoman government in a policy of moderate decentralization along racial lines and to try and win the Balkan peoples to acquiescence, without, however, going so far as actual intervention. His specific proposal was for a court of arbitration consisting of three representatives of the powers and two of Turkey to decide the points at issue between the latter and the Balkan kingdoms, and that meanwhile a plan for "progressive decentralization" should be carried out in Macedonia and Albania. This was taken as indicating Austria's intention of taking the initiative in Balkan affairs and was regarded with suspicion by the Balkan states and with apprehension by the Turks. The latter declared it a step toward dismemberment. The powers accepted it provisionally, but awaited an explanation of what was meant by "progressive decentralization." In Russia there was much talk of Austria's intrigues to have Turkey support her policy of Slav expansion. Russians favored a policy of strengthening the Balkan states at the expense of Turkey, while Austria aimed at keeping them overawed by maintaining the Ottoman power.

THE BALKAN ALLIANCE. The Turco-Italian War offered an opportunity of taking Turkey at a disadvantage. From the beginning of that war the danger of concerted action on the part of the Balkan states against Turkey had been imminent. It was enhanced by the Albanian revolts in 1911 and 1912, which not only further drained the resources of the Ottoman government, but by their final success in wresting from it the desired reforms spurred on the Balkan powers to demand a new system for Macedonia. In addition to all this was the exasperation caused by the accounts of the Turkish massacres of Christians—at Ishtib in 1911, at Berane, Kotchana, and elsewhere in 1912. Nevertheless peace was expected till the last moment because it seemed incredible that the great powers could not, if they seriously united in the attempt, prevent the war. It was clear that they could do so if they once made it evident that they stood ready to back up their demands by force. But mutual distrust and jealousy made that course impossible. The aims of Austria and Russia were too far apart to admit of a union of the powers in

such direct coercive action as would prevent the war. Therefore they merely threatened. The Balkan states realized this weakness, and paid no attention to the threats. A definite understanding was reached in February by the governments of Bulgaria, Serbia, Greece, and Montenegro. Owing, it is said, largely to the statesmanship of M. Venezelos, the Greek premier, jealousies and conflicting interests were not permitted to divide the states or keep them from their central purpose. An alliance was formed to free the men of their religion and race from Turkish rule and to press on to the overthrow and dismemberment of Turkey in Europe. The events mentioned above in Macedonia and Albania during the year angered the people of the Balkan states and held their governments together.

Greece, Bulgaria, and Serbia naturally sympathized with the men of their race in Macedonia. In Bulgaria, where public opinion was greatly agitated by the report of the Kotchana massacre, a mass meeting was held at Philippopolis on August 21 and the immediate liberation of Macedonia demanded. In Montenegro the war feeling was aroused by the repeated conflicts between Turks and Montenegrins on the border. As stated in the preceding **YEAR BOOK**, Montenegro sympathized with the Albanian rebels. Many of the latter had found refuge within her borders and the Turks complained of the frequent attacks by Montenegrins on the border. As to Serbia, one of the many incidents that angered the people was the massacre of Christians, mostly Serbs, by Musulmans in the town of Senitza in Novibazar in July. Novibazar, having been evacuated by Austria under the terms of her annexation of Bosnia-Herzegovina, was left a prey to Turkish raids. As to Greece, reports of Turkish atrocities in Thessaly stirred the popular wrath.

THE BEGINNING OF THE WAR. On September 30 Bulgaria ordered the mobilization of her troops, raising the strength to about 400,000 men. Mobilization orders were issued at the same time by Serbia, Montenegro, and Greece. Turkey retorted immediately by a similar order of mobilization. The neutral powers at once began to bring pressure on both sides to prevent hostilities, but without avail. The four Balkan states had determined to act together and to insist on taking advantage of Turkey's distressed internal condition and her war with Italy and secure an autonomous government for Macedonia pursuant to article XXIII. of the Berlin Treaty. To this Turkey was unalterably opposed. It was seen from the first that unless the neutral powers proceeded to the extreme of using force they could not bring about a plan for settlement. The immediate cause of war, as alleged by the Bulgarian government to the powers, was the threatening attitude of Turkey on the frontier. The Turks had ordered manœuvres of their troops in the neighborhood of Adrianople, and when the ambassadors of the powers protested the Turkish government replied that the manœuvres were of annual occurrence and in no wise a threat against Bulgaria. In the case of Serbia it was the detention by the Turks at Salonika and Uskub of ammunition destined for the Servians. Meanwhile conferences had taken place between Count Berchtold and the German chancellor at Buchlau, September 8; between M. Sazonoff and Sir Edward Grey later in the month, and finally between M. Sazonoff

and the French premier, M. Poincaré. At the instance of M. Poincaré it was proposed that Russia and Austria should act as mandatories of the powers in the Balkan capitals and that the powers should act collectively at Constantinople. This was accepted. On October 8 the Austro-Hungarian and Russian ministers delivered a joint note to the Balkan states declaring that the powers would energetically reprove any measures tending to break the peace, that they would proceed on the basis of article XXIII. of the Treaty of Berlin and undertake to realize the reforms in the administration of Turkey in Europe, but that these reforms would not violate the integrity of the Ottoman empire or the sovereignty of the sultan; that if war should break out they "would not permit at the end of the conflict any modification of the territorial *status quo* in European Turkey." This came too late. On the same day Montenegro formally declared war, and on the following morning (October 9) the Montenegrin army began the war with an attack on the Turkish position at Podgoritz. After a four hours' artillery engagement the Turks evacuated the heights and the Montenegrins then advanced to attack them in their fortified position at Detchich. On October 9 King Nicholas of Montenegro issued a proclamation summoning his people to a "holy war" in which they would have the sympathy of the civilized world, of the Serb people, and of the Slav race, and the loyal support of Bulgaria, Servia, and Greece. He called on them to come to the aid of their brothers in Old Servia, where men and women were being massacred by the Mussulmans. Meanwhile the Turkish government had submitted a plan of reform for Macedonia, but it was regarded by the Balkan states as altogether inadequate. On October 13 Bulgaria, Servia, and Greece dispatched an identical note to Turkey requiring the establishment of Macedonian autonomy under European governors within six months. The autonomy was to be complete and would exclude the Porte from all control of the administration. Upon receipt of the note Turkey immediately recalled her representatives from their respective capitals. Another consequence was the signing of the preliminary peace with Italy on October 15. (See TURCO-ITALIAN WAR.) Regarding this note as an ultimatum, Turkey announced to the powers on October 16 that it had severed diplomatic relations with the three governments. The latter thereupon issued their declaration of war (October 17). Estimates of the available strength of the respective states on the eve of the war differed widely. According to some authorities they were as follows: Turkey, 500,000; Bulgaria, 400,000; Servia, 150,000; Greece, 80,000; Montenegro, 50,000. Toward the close of the year the following estimate was published: Turkey, 400,000; Bulgaria, 300,000; Servia, 200,000; Greece, 150,000; Montenegro, 40,000.

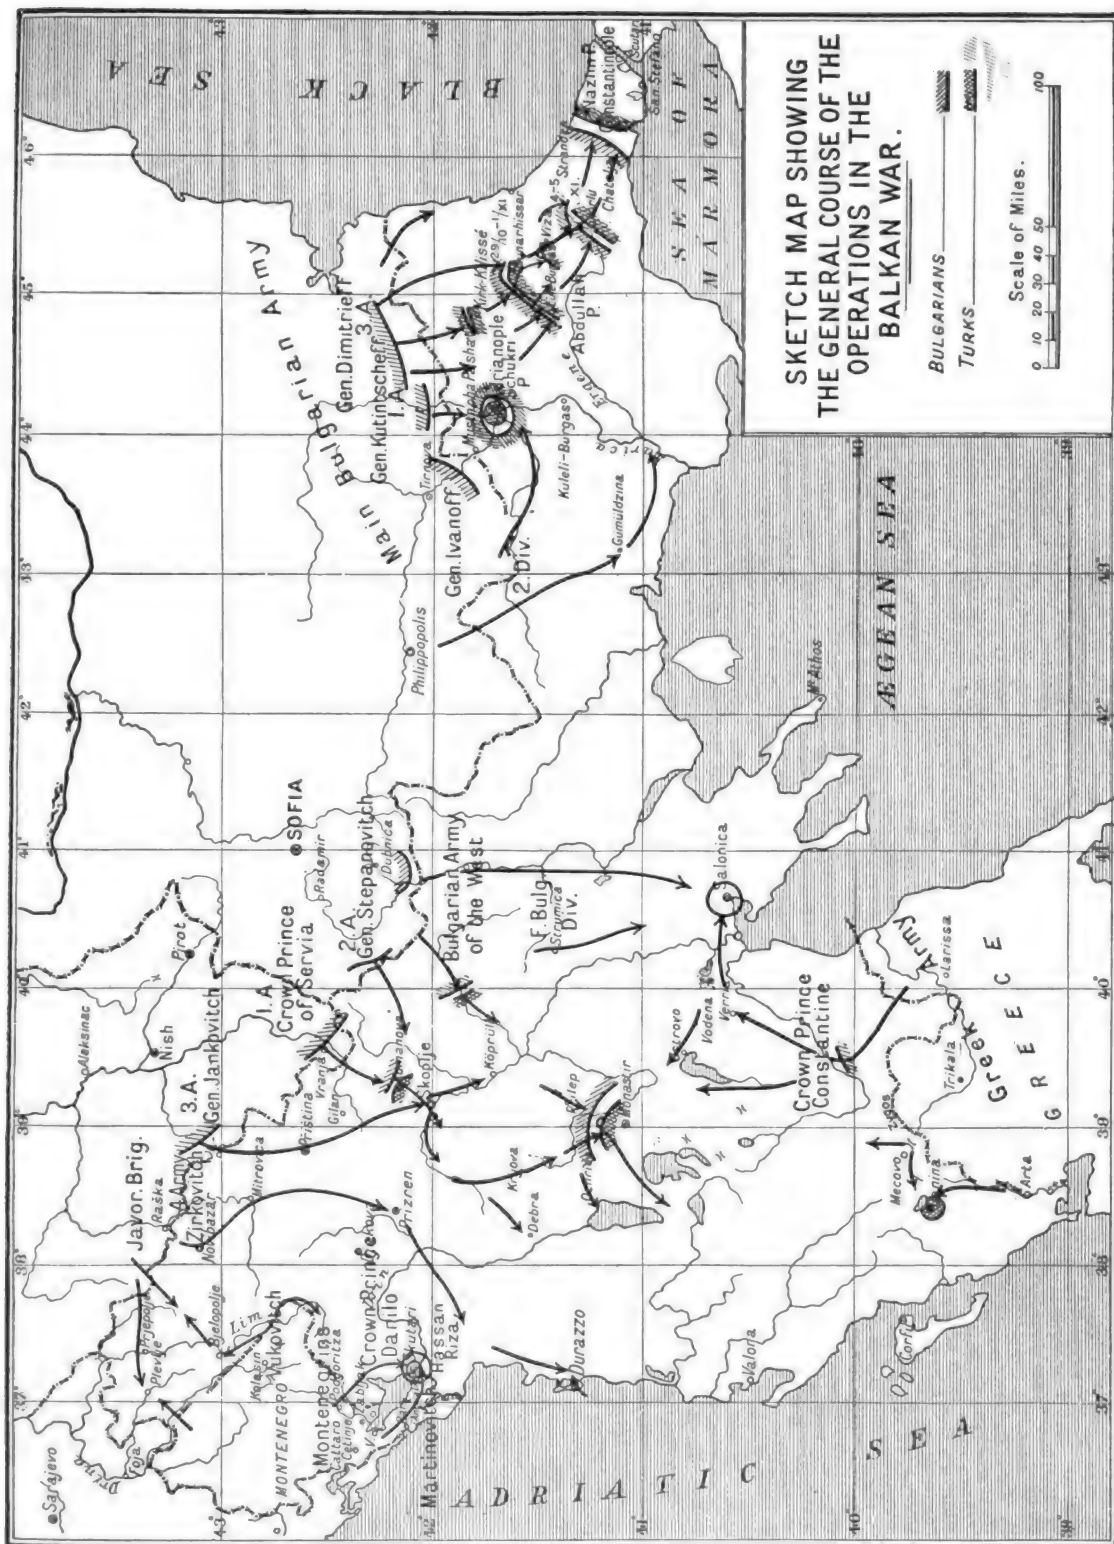

THE WAR IN OCTOBER. Within less than three weeks from the beginning of the war the four armies of the Balkan allies had crossed their respective frontiers, advanced into Macedonia, driving the Turks before them, captured Prishtina and Kumanovo, routed the Turks at Kirk-Kilise, invested Adrianople, and rolled back the main body of the Turkish army in the direction of the Tchatalja forts, the last main line of defenses on the way to Constantinople. A little

later in the three days' battle of Lule-Burgas (October 28-30) the Bulgarians gained a decisive victory over the Turks, who were now forced to retire behind the Tchatalja defenses. The first act of the war occurred on October 9, and by the end of the month the allies had practically possessed themselves of Macedonia and the Bulgarians were holding the main Turkish force behind a fortified line within fifty miles of Constantinople, and seemed in a fair way to force that position and enter the city itself. This extraordinary and rapid success caused the greatest surprise in Europe, where the press had for years overestimated the military strength of Turkey and belittled that of the Balkan states. The following outline presents the movements a little more in detail.

GENERAL PLAN OF CAMPAIGN. The military plans of the four Balkan powers seem to have been well coördinated and directed to a common purpose. The chief objective of the Montenegrin campaign was Scutari. The Servians aimed at overthrowing the Turkish forces in Macedonia in coöperation with the Montenegrins in the west and the Greeks in the south and then to dispatch a force to seize a port at Durazzo on the Adriatic. The Greek attack was directed to the capture of Salonika. The Bulgarians, whose forces were the strongest, were to perform the chief task of overwhelming the Turks in Thrace and pushing them back to Constantinople. Thus the Turks were attacked at the same time in four separate regions and were unable to concentrate and act on the offensive. Their commander-in-chief was Nazim Pasha, who was appointed on October 3. It was soon seen that in the face of the vigorous and rapid assault of the Balkan armies the Turkish military organization had fallen into a deplorable state of inefficiency and unreadiness.

THE MONTENEGRIN CAMPAIGN. The Montenegrin forces were divided into three armies, one to operate against Berane, the other two having for their objective, Scutari. On October 9 they entered Albania on the northwest. The northern army, constituting the left wing, occupied Berane on October 16, rapidly took possession of several other places in the sandjak of Novi Bazar, and then captured Ipek and Djakova. The main force reduced Detchitch and Tuzi, and on October 26 began the investment of Scutari. Meanwhile they had found the Turks in a strong position at Tarabosh, which they bombarded and several times attempted to storm, losing considerable numbers. They were unable to accomplish the main purpose of capturing Scutari, which was still holding out when hostilities were suspended on December 3. At that time, however, they were occupying San Giovanni di Medua on the Adriatic, which was one of the important objects of their campaign.

THE SERBIAN OPERATIONS. The commander-in-chief of the Serbian forces was General Putnik. The first and strongest Serbian army formed the centre and was commanded by the crown prince. The second, constituting the left wing and including the Bulgarian contingent, was under the command of General Stepanovitch. The Turkish troops in Macedonia were commanded by Zekki Pasha. The Servians began active operations on October 18, when the centre, under the crown prince, crossed the frontier near Vrania and advanced along the road to Uskub. This and Kumanovo were its

84011

objectives. The left wing was to operate against Uskub by way of Egri-Palanka, while to the west of the first, or main body, was a force of 32,000 men which was to operate in the plain of Kossovo. The last named, under General Yankovich, captured Prishtina on October 22 and Novi Bazar on the following day. The fighting at the latter place was severe. The Turkish forces under Zekki Bey, whose numbers were variously reported at from 30,000 to 80,000, were employed against the main Servian army. But though they fought desperately they were unable to check the advance. In a severe engagement which lasted some 60 hours they were defeated at Kumanovo with an estimated loss of 5000, and fled in disorder. A second defeat followed on the road between Kumanovo and Uskub and again the retreat became a rout, the Turks abandoning a large quantity of ammunition and many guns, and leaving their dead and wounded on the field. On October 26 the Servians entered Uskub in triumph. Many of the Turks scattered in panic, but the main body withdrew toward Monastir. On October 27, the Servians, after driving the Turks back with heavy losses from Kotchana and Ishtib, captured Kuprulu. The Turks came to a stand in a narrow defile of the mountains between Kuprulu and Perlepe, whence the Servians tried to dislodge them on November 3. This was accomplished, but only after a long battle, in which the Servians suffered heavily. Meanwhile, one portion of their army had been dispatched in the direction of Scutari to coöperate with the Montenegrins, another toward the coast at Durazzo, and the third to join the Greeks in the neighborhood of Salonika. But the main body advanced to Monastir, which, after two days of desperate fighting, was captured on November 18. The last important success of the Servians was the capture of Durazzo on November 28. The victorious advent of Servia on the Adriatic coast gave rise to international complications noted in a paragraph below.

THE BULGARIAN CAMPAIGN. The brunt of the war fell on Bulgaria, whose army was by far the strongest and was known to be well equipped and trained. For years past, preparations had been made for such an emergency and in 1912 General Savoff, the organizer of the Bulgarian forces, had announced that they were completely ready for war and were able to defeat the Turks. The war strength of Bulgaria was estimated at 330,000 men. Bulgaria had completed her organization while radical changes in the Turkish military system were still going on. At the beginning of October Turkey had discharged her time-expired men and filled their places with new men, many of whom were Christians. Bulgaria had kept with the colors some of the time-expired men for the ostensible purpose of participating in the manœuvres. Turkey, moreover, was greatly hampered by the scattering of her forces and could count on little help from the troops in Asia, not only on account of the distances to be covered, but because the Greeks controlled the situation at sea, being ready to intercept transports from Asia Minor or the Islands. After Montenegro declared war, Bulgaria mobilized her infantry in five days. Owing to the lack of horses the artillery and supply trains were delayed until the eleventh day. A few days later their position was, according to the military authorities, as follows: Chief grouping, 8 active divisions,

5 reserve brigades, and one cavalry division, all constituting the army of the Maritza and concentrated in the zone Tirnovo-Seimeu-Stara-Zagora on both sides of the Maritza, comprising in all 225,000 men; secondary grouping, about 75,000 men which, with the addition of 2 active Servian divisions, formed the army of Kustendil. On the declaration of war (October 17), the Bulgarian forces immediately crossed the frontier in three corps. Mustapha Pasha was captured on October 19. One body then proceeded eastward by rail toward Adrianople. The generals in command of the three Bulgarian armies were General Kutincheff, General Ivanoff, and General Dimitrieff. The commander-in-chief of the Turkish army was Nazim Pasha, while directly in command of the third corps and engaged in the fighting around Kirk Kilisse was Mahmud Mukhtar Pasha.

THE BATTLE OF KIRK KILISSE. The attacks on the Turkish positions in the neighborhood of Adrianople began on October 22. The accounts of the battle are conflicting. Owing to the extreme severity of the censorship, the correspondents had small chance of reporting the military operations, and few of them were permitted to ascertain what was going on. It appears, however, that on October 23 there was heavy fighting all along the line. Several of the fortified positions were carried by bayonet charges and a counter-attack of the Turks to the north-east was repulsed with heavy loss. On the night of October 23 the Bulgarians captured several positions in the north and mounted artillery on the heights. On the following morning, October 24, they began to bombard Kirk Kilisse, which was soon in flames. At the same time the infantry advanced along the battle front and by 10 o'clock the Bulgarians had forced their way into the town, whence, after an hour's fierce street fighting, the enemy was driven out with a considerable loss and in some disorder.

According to Lieutenant Hermenegild Wagner, the special correspondent of the Vienna *Reichspost*, in his volume *With the Victorious Bulgarians*, about 1500 Turks were taken prisoners at Kirk Kilisse. He places the total strength of the Turks in the battle at about 70,000 men, of whom, however, a large number were either in action only for a short time or took no part in the fighting.

LULE BURGAS. The operations of the Bulgarian armies were now directed to cutting off the retreat of the Turks, but the latter in the course of some severe fighting effected a change of front. The Turkish left wing was withdrawn to Lule Burgas, under the command of Abdullah Pasha. On October 29 began the sanguinary battle of Lule Burgas-Bunar Hissar, the chief battle of the war, which extended along a front of about 22 miles. During the engagement reserves were brought up by General Kutincheff from Adrianople. Three attacks on the Turkish centre were repulsed and the position was only carried after a hand-to-hand conflict. The Bulgarian generals did not restrain the ardor of the troops, and movements, especially infantry charges, involving great sacrifices of life were carried out with remarkable heroism. The losses on each side were very heavy. The Turks were ill-supplied with food and ammunition and suffered also from defective leadership. The well-directed Bulgarian artillery fire wrought havoc among them. At last they began to retreat, but without panic, and the fight-

ing did not actually cease till November 2. The strength of the Turkish army was placed at 150,000. The estimates of their loss in killed and wounded vary from 25,000 to 40,000 and in prisoners from 2000 to 2800. A rough estimate placed the loss of the Bulgarians at 15,000.

The Turks now fell back on Tchorlu and a little later withdrew behind the Tchatalja lines. The investment of Adrianople was now complete. Leaving some 20,000 reservists there and taking all the troops available, the Bulgarians advanced against the Tchatalja forts, the last line in defense of Constantinople, hoping to carry it and reach the city. On November 12 they began the attack, but the Turks successfully stood their ground. To carry the strong defenses involved heavy loss, and it was hoped that the cholera, which had broken out among the Turks, would lead them to surrender. The Turks opened negotiations for an armistice on November 13, and operations were suspended, but when the allies presented their terms on November 20, they were at once rejected. On November 25, however, a meeting was arranged between General Savoff of the Bulgarians and Nazim Pasha, the Turkish commander-in-chief and minister of war, and three days later the negotiations were definitely resumed at Tchatalja between General Savoff, Dr. Danef, and King Ferdinand's private secretary on the one hand, and Nazim Pasha and two members of his cabinet on the other. Finally, on December 3, a protocol was signed for an armistice which was to last until the end of the peace negotiations.

Mr. Ellis Ashmead Bartlett, who accompanied the Turkish army and published an account of his experiences in a volume entitled *With the Turks in Thrace*, declared, in common with many others, that the responsibility for the disaster should not be laid on the Turkish soldier. He says:

"The responsibility rests solely on the administrative classes and high officials, who, eaten up with pride and self-confidence, and regarding all the Balkan states with the utmost contempt, believed the Turkish army to be invincible. The army was caught utterly unprepared for war, and the military authorities remained blind in their belief that mere numbers set forth on paper and published broadcast in the press would win the day against an army smaller in numbers, but which had been carefully organizing and preparing for war for twenty-five years."

"It is impossible for me to describe severely enough the utter state of chaos, mess, muddle, and make-believe, which exists throughout all branches of the army. Had the Turkish soldier been supplied with even one biscuit a day he might have held his ground against the invader, and I am convinced that he has been defeated more by sheer starvation than by any other single factor."

"Looking back to the great tragedy, it is almost impossible to understand how the wretched private soldier existed for three days without a scrap of food, without shelter, and yet covered himself with glory. The most splendid material has been sacrificed on the altar of stupidity, conceit, self-satisfaction, and the grossest ineptitude."

GREEK CAMPAIGN. On the eve of the war, Greece seems to have concentrated the main body of her forces, 56 battalions, in the region

of Larissa and the remainder in the region of Arta. Immediately after the declaration of war on October 17, the main body under the crown prince advanced with the ultimate object of reaching Salonika while the smaller army began to move from Arta against the Turks at Janina. The Turkish forces under Hassan Tahsi, withdrew before the advance of the crown prince, and on October 20 the Greeks captured Ellassona without much opposition. They won a decisive victory over the Turks at Selfidje on October 23. After capturing a number of other towns in the region and defeating a Turkish force of considerable strength, which was sent to attack their rear, they advanced at the end of October on Monastir and Salonika. On November 1 the column marching on Salonika was temporarily repulsed, but soon recovered its lost ground and forced its way on. The condition of the Turks in the defense of Salonika was deplorable and they were unable to offer effective resistance. After a two-days' investment the town was surrendered on November 8. The number of the Greeks was placed at about 60,000 and of the Turks at about 25,000. The capture of Salonika was hailed with enthusiasm throughout all Greece as the recovery of the ancient heritage of Hellas after Ottoman domination for 470 years. The officer immediately in command of the Greek army at Salonika was General Kleomenes. A Bulgarian division and a Servian regiment entered Salonika on November 9 and there were rumors of jealousies among the allies. It was reported, in fact, that the Greek commander-in-chief objected to the entry of the Bulgarians and that the Bulgarian government had overcome this opposition only by firm insistence. There were again signs of discord between Greece and the other allies when the armistice of December 3 was announced. Greece rejected the terms of the armistice and continued operations on land and sea, but without important results. Greek troops had been landed on the Island of Lemnos on October 21.

INTERNATIONAL ASPECTS OF THE WAR. Meanwhile, the European powers had continued their efforts for peace. M. Poincaré, whose first proposal for joint action on the part of Russia and Austria-Hungary has been noted above, offered another proposal early in November to the effect that the powers should pledge themselves to "territorial disinterestedness," but this did not meet with favor among the members of the Triple Alliance, of whom Austria-Hungary occasioned the chief apprehension. Her government had several times announced its purpose of taking all the necessary steps to protect its own vital interests. It was known to be hostile to any movement that would bring Serbia to the Adriatic or, by imposing a barrier of Slavic states, cut Austria off from the road to Salonika. Toward the end of November Sir Edward Grey proposed that representatives of the respective powers should be authorized to confer on the Balkan question at one of the European capitals. This was accepted and London was designated as the place for the conference. Soon after the appearance of the Bulgarians before the Tchatalja lines, Turkey had asked the powers to mediate and had received a reply that no terms unacceptable to all the belligerents would be forced upon them. There was a suspension of hostilities during the exchange of views between Turkey and the allies concerning the terms of

an armistice, but the conditions required by the allies were too severe and hostilities were accordingly renewed. Then came the armistice of December 3, declaring hostilities suspended in order that negotiations for peace might go on.

PEACE NEGOTIATIONS. The original demand of the allies included the withdrawal of Turkish troops from Tchatalja, the surrender of Adrianople, and practically the abandonment of the Turkish domain in Europe. The peace conference in London began on December 16, after some delay on account of the unwillingness of Turkey to treat with the Greek representatives while their government was not a party to the armistice. The regular discussion of the terms of peace began on December 23. Meanwhile, the exchange of views between the representatives of the foreign powers in London as proposed by Sir Edward Grey was going on, and the outcome of these informal conferences was announced on December 20 to be the recommendation of the ambassadors to their governments of the acceptance of the principle of Albanian autonomy and of a guarantee to Serbia of commercial access to the Adriatic. The agreement of the powers on these two important points quieted the apprehension that had long prevailed as to the danger of a general European war. But the delegates to the peace conference could not agree. The allies demanded terms which Turkey regarded as too humiliating. They included the surrender of all Turkey in Europe except a small strip in the neighborhood of Constantinople. Turkey proposed, on the other hand, the retention of the province of Adrianople and the Aegean Islands, and of her sovereignty over Macedonia and Albania, which were to be autonomous provinces; and the withdrawal of the Cretan question from the discussion as it involved only Turkey and the great powers. At the close of the year there seemed little prospect of a settlement. The principal figures in the negotiations for peace were Dr. Daneff, the president of the Bulgarian Sobranje, and M. Venezelos, the premier of Greece. The head of the delegation from Turkey was Mustafa Reshid Pasha.

The Austro-Servian difficulty mentioned above arose from Serbia's insistence on her right to retain Durazzo and a small strip of the adjacent Albanian coast and from her objection to the autonomy of Albania. Austria-Hungary's opposition to the access of Serbia to the Adriatic finally took the form of actual preparations of war. Before the armistice she had begun the mobilization of her troops throughout the empire. The menacing attitude of Austria-Hungary led to a series of declarations by the powers which indicated an alignment of the two great groups, namely, the Triple Entente and the Triple Alliance, on the question, and led to fears of a general European war. On November 9, the British premier, Mr. Asquith, declared that public opinion in his country was unanimously opposed to a policy that should rob the victors of their spoils. Later in the same month, the German chancellor declared that if the other members of the Triple Alliance were attacked by a third power while they were maintaining their interests, Germany would take their part. On December 6 the French premier declared that France would stand by her allies and her friendships. The official announcement of the representatives of the powers in London on December 20 of the acceptance in principle of the Albanian autonomy and of the

commercial access of Serbia to the Adriatic, quieted the fears of a European war and public opinion was reassured by the report before the close of the year that Austria-Hungary and Serbia had come to an agreement whereby the latter was to have access to the Adriatic but was to recognize Albanian autonomy.

TURKS AND CAICOS ISLANDS. British islands of the West Indies, dependent upon Jamaica (169 sq. miles, 5615 inhabitants), census of 1911). Grand Turk is the principal island and the government seat. Imports (1910), £27,916; exports, £24,461; revenue, £8645; expenditure, £8827; shipping entered and cleared, 280,735 tons. Commissioner (1912), F. H. Watkins.

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE. An institution for the industrial and higher education of negroes, at Tuskegee, Ala., founded in 1881. The number of students enrolled in the various departments of the institute in the autumn of 1912 was 1645. The faculty numbered 181. There were no noteworthy changes in the faculty during the year and no notable benefactions were received. The productive funds of the institute at the close of the year 1911 amounted to \$1,859,015, and the income for the year 1911-12 was \$75,963. There were about 45,000 volumes in the library. President, Booker T. Washington, LL. D.

TUTTLE'S COMET. See ASTRONOMY.

TYPHOID FEVER. See INSECTS AND THE PROPAGATION OF DISEASE, and SANITATION.

TYPHOID FEVER. Several recent outbreaks of typhoid fever have been traced to "carriers," one of which, showing at what distances these people may operate in disseminating infection, may be cited. Bolduan and Noble, of the New York City health department, while searching for the cause of an apparently unexplainable epidemic of typhoid which appeared in certain districts of the city, finally narrowed the source down to the milk supply. On tracing the source of infection back through the wholesale dealer to the shipping station in the country, it was found that the infected milk came from Camden, N. Y. The former manager of the creamery there had typhoid fever at the time of inspection, but judging from the date of onset he was apparently one of the victims of the infection and not the cause of it. There had also recently been a case of typhoid fever on the dairy farm of X., one of the three local milk dealers of the village, but not a patron of the creamery. Further inquiry showed that there had been an undue prevalence of typhoid fever in Camden for years; in fact, it was called by several physicians "Camden fever" and believed not to be typhoid fever at all. It is estimated that the number of cases of typhoid in the village had not averaged less than fourteen or fifteen each year, which is at the rate of fifty or sixty per 10,000 of population. The rate for New York City during this time ranged from six to ten per 10,000. A tabulation of all the cases occurring in the village in 1908 and 1909, twenty-seven in number, showed that twenty received milk from Dairy X. Investigation of the dairy and home of Dairyman X. showed both to be exceptionally clean and well kept. This man had come to Camden in 1866, a year or two after he had recovered from typhoid. Several cases of illness had occurred in his own family or employees during the succeeding years, all of them believed to have been

typhoid fever. Examination of his excreta gave an almost pure culture of typhoid bacilli. This dairyman had been selling most of his milk in Camden, but a few quarts a day were added to a neighbor's supply, which was shipped to New York, and thus started what would doubtless have been a serious epidemic had not the facts been discovered and the infected milk cut off.

The value of the Widal test in detecting typhoid carriers is not fully agreed upon. Bigelow states that most carriers may be detected by an examination of the blood after this method, and cites a number of instances where it proved serviceable. One case is cited to show that the excreta may be apparently free from bacilli and yet react positively to the Widal test. In the family of a man dead from typhoid several other cases occurred. In this same family was a man who had had an attack of typhoid eighteen months previously, followed by necrosis and abscess formation about the sternum. In spite of an operation a year previously, he still had two small pus-discharging sinuses over the sternum leading down to the bone bare of periosteum. His blood gave a positive Widal reaction. On three different examinations his urine and feces were found negative for typhoid bacilli, but the pus from the sinuses over the sternum was positive on each of these occasions.

Prophylactic vaccination against typhoid has now been practiced long enough to enable us to estimate the duration and degree of immunity conferred by this measure. From the rich experience of the British army in India, Colonel Firth concludes that immunity begins to diminish in about two and one-half years after inoculation. His tables also show that even after four and five years, the maximum period of observation, the rate per thousand among the inoculated is, roughly speaking, only one-fourth that of unprotected troops. It is known that the immunity is not absolute, for in 1911, among 80,000 persons vaccinated in the United States army, there were twelve cases of typhoid with one death, and in 1910 there occurred six cases among the vaccinated, with no fatalities. Had it not been for the prophylactic immunization there would have occurred, at the prevailing rates of incidence, about 250 cases. The fact that the immunity is not absolute is no objection to the use of vaccine, but is rather an argument for its repetition at intervals to be determined in the future as the lessons of experience become clear, just as we now do in the case of smallpox. It is the present practice to revaccinate against both smallpox and typhoid at the beginning of each three-year period of enlistment. The failure to secure absolute protection in these few cases may be due to inefficiency of the vaccine, to exposure of the patient to exceptionally large quantities of infectious material, or inability of the individual to respond to immunization with the usual antibodies; and this failure can best be interpreted as a personal idiosyncrasy.

TYRAMINE. Tyramine is para-hydroxy-phenyl-ethyl-amine hydrochloride ($\text{OH}\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{NH}_2\cdot\text{HCl}$), the hydrochloride of the para-hydroxy-phenyl-ethyl-amine ($\text{OH}\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{NH}_2$), obtained synthetically. The base para-hydroxy-phenyl-amine was first isolated by Barger from ergot and also prepared synthetically by him by the reduction of para-hydroxy-

acetonitrile with sodium in alcoholic solution. It is chemically and physiologically related to epinephrine. Tyramine is a white crystalline powder, easily soluble in water, forming a neutral solution. Taken internally or injected subcutaneously, tyramine increases the blood pressure; for this reason it can be used in shock or collapse; it is also claimed to be valuable for producing post-partum contraction of the uterus. It is useless as a local hemostatic. The action is similar to epinephrin, being weaker and slower, but lasting longer. It is given subcutaneously.

UGANDA PROTECTORATE. A British possession in east Africa (estimated, 117,681 sq. miles, exclusive of lake area) made up of five provinces—Rudolph, Eastern, Northern, Western, and Buganda. Population, between two and three millions. Neither area nor population can be accurately stated, no survey having been completed and no complete census taken. Mengo is the native, Entebbe the British capital. Malaria, spirillum fever, dengue fever, and sleeping sickness are prevalent, and the country is not suited for European habitation.

	1907-8	1908-9	1909-10	1910-11

Exports *	178,608	174,413	225,258	340,326a
Revenue	111,883	102,572	165,145	287,094
Expenditure	195,528	256,337	240,241	276,157

* Including transit.
a £306,609 exclusive of re-exports. Export of ginned cotton, £120,664; unginned, £44,748; ivory, £35,674; hides, £20,544; skins, £26,691; chillies, £20,492; rubber, £13,569.

The so-called Uganda Railway lies entirely in the East Africa Protectorate. In 1911 the line from Jinja to Kakindu (over 54 miles) was completed. The king of Uganda is Daudi Chua (born August 8, 1896); regent, Sir Apolo Kagwa. Governor and commander-in-chief, F. J. Jackson.

UNEMPLOYMENT. Since the industrial depression of 1907-8 an unusual amount of attention has been given to the problem of unemployment in the United States and western Europe. This problem arises from the existence of considerable numbers of able-bodied and efficient workers who, although often on the verge of poverty, can find no remunerative work. The various policies for solving this problem include vocational training and guidance on a comprehensive, if not universal, scale; the distribution of the construction work of cities, towns, and States so as to dovetail with the fluctuations of private industry; the better organization and regularizing of such seasonable trades as clothing manufacture, millinery, dressmaking, and mining; efforts at the decasualization of those trades where the demand for labor is intermittent, as in freight handling in maritime ports; various forms of employment insurance; and a better distribution of population and industries, especially all policies for the relief of city congestion.

In the United States there have been passed in Indiana, Missouri, Massachusetts, Michigan, and Montana laws establishing and regulating

public employment bureaus. Numerous other States have enacted legislation regulating private employment agencies with the view to eliminating their exploitation of the unemployed. The National Employment Exchange was organized in New York City in 1909 as a private but non-profit making bureau for locating men in mercantile and manual work. Though it has succeeded in placing some thousands of men, its experience indicates that the problem of unemployment in the great cities is exceedingly difficult. This is largely owing to the fact that the demand for labor declines in the winter at the very time that detached laborers from the surrounding country are gravitating toward the metropolis.

GREAT BRITAIN. The problem has been unusually acute in the British Isles in recent years. The cities have endeavored to meet the situation by providing public work on parks and highways. This, however, was very inadequate. The government therefore began the establishment in 1910 of exchanges throughout the entire country. Early in 1912 the number of these exchanges approximated 250 in ten districts of Great Britain and one district in Ireland. All local offices are connected with a central district office by telephone and telegraph and the district offices are similarly connected with the central office in London.

This system of labor exchanges is to be supplemented by a comprehensive scheme of insurance against unemployment. This insurance programme has been begun by provision for unemployment insurance in the engineering trades. See **WORKINGMEN'S INSURANCE**.

In their intensive study of unemployment in the city of York, England, Messrs. Rowntree and Lasker showed the close relation of this problem to the lack of vocational training and to "dead-end" or "blind-alley" trades. They insisted, therefore, on vocational training and guidance. They found in the irregular and casual workers men who had been neglected or unfitted for industry in their youth. Their programme for reform included the following: Better training for youths; regulation of work of public bodies; afforestation; decasualization of labor; insurance; and decentralization of town population.

LIVERPOOL DOCK LABOERS. One of the most trying problems connected with the alleviation of unemployment grows out of the economic conditions of the casual worker. For many years the status of the Liverpool dock workers has been studied from this point of view. In recent years more than 27,000 dock laborers have been available where not more than 16,000 could hope to find work on any one day. An important step in the decasualization of this labor was made during the summer when a new clearing house system was established. This plan does away with the nearly 100 booths where laborers have been hired daily and substitutes clearing houses in definite areas. All clearing houses communicate with the central office. Men are required to register at these clearing houses. The plan is expected to reduce the influx of destitute and undesirable workers and to distribute uniformly the available work among the much reduced supply of workers. The expenses of these clearing houses are borne by the Board of Trade, the work being done by officials of the government labor exchanges. The machinery thus established also serves as a

more convenient means of paying wages and as a means of arranging for the payment of the compulsory weekly contributions under the national insurance act. It was only by some system of registration that casual workers could be brought under that scheme. Through misunderstanding the introduction of the plan precipitated a short strike, although the dockers' union officials were favorable to the system.

THE INTERNATIONAL COMMITTEE ON UNEMPLOYMENT met in Zurich, Switzerland, in September. Seventeen countries, including all the principal countries of Europe and the United States, were represented. Topics of discussion included the preparation of schedules and methods for uniform and scientific collection of facts in regard to employment; public works in their relation to unemployment; emigration and immigration. The American delegates presented plans for the formation of an American section of the International Association on Unemployment. The next congress of this association will meet in Ghent in 1913.

INSURANCE. The belief steadily gains ground that some form of insurance is necessary to prevent the evil social consequences of unemployment. Various plans are now in operation. The British trade unions generally and the American unions in some instances pay out-of-work benefits. The chief objection to this plan is that no provision is made for the great mass of unorganized laborers who have smaller economic resources and are therefore more likely to suffer poverty and degradation from periods of unemployment. The cities of the Continent have developed two plans of public municipal insurance. One of these involves the payment from the public treasury of a subsidy to unions paying unemployment benefits. The other provides for an insurance fund to which any citizen may contribute stated amounts for a minimum number of weeks and receive out-of-work benefit for a proportionate time. The city usually subsidizes such a fund. A similar fund is sometimes created and operated by a voluntary citizens' organization. In Germany, where these forms of municipal insurance against unemployment have been widely developed, there is a strong demand for a comprehensive and compulsory system as a part of the imperial plans for workingmen's insurance. For the British plan see **WORKINGMEN'S INSURANCE**.

UNIFORM LAWS. UNITED STATES COMMISSION ON. See **CHILD LABOR**.

UNION COLLEGE. An institution of higher learning at Schenectady, N. Y., founded in 1795. The enrollment in all departments of the college in the autumn of 1912 was 338. The faculty numbered 32. There were no noteworthy changes in the faculty during the year and no important benefactions were received. The productive funds at the end of the collegiate year 1911-12 amounted to \$843,730, and the approximate income from all sources was \$42,200. The library contains about 40,000 volumes. President, C. Richmond, D. D.

UNION PACIFIC RAILWAY. See **TRUSTS**.

UNION PACIFIC-SOUTHERN PACIFIC MERGER. See **TRUSTS**.

UNITARIANS. The distinctive feature of this denomination is the acceptance and adoption of the principles of freedom and progress in religious thought. The American Unitarian

Association is the administrative body of the church. Its headquarters are in Boston. According to statistics gathered by Dr. H. K. Carroll, the Unitarians in 1912 numbered 70,542 communicants, 476 churches, and 527 ministers. The denomination is active in distributing its literature and in organizing conferences for the promulgation of Unitarian thought. It has considerable strength in Great Britain, where there are 375 ministers and 370 congregations. The divinity schools are at Cambridge, Mass.; Meadville, Pa., and Berkeley, Cal. Missionary work is carried on at many points among Icelandic, Norwegian, and Swedish immigrants of the United States. Among the more important publications are the *Christian Register*, published in Boston; the *Unitarian Advance*, published in New York, and the *Pacific Unitarian*, published in San Francisco. The president of the American Unitarian Association is the Rev. Samuel A. Eliot and the secretary the Rev. Lewis G. Wilson.

UNITED KINGDOM. See GREAT BRITAIN.

UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA. This denomination was formed in 1853 by a union of associate and associate reformed churches. The general assembly met in Seattle, Wash., on May 22, 1912. The boards and institutions reported a successful year. The returns show a decided increase in the missionary spirit and a marked enlargement of the evangelistic work. The church cultivates the most cordial relations with other evangelical denominations and seeks coöperation with them, but does not as yet see the way clear for organic union. A communication was received from the general assembly of the Presbyterian Church in the United States that it had appointed a committee to confer with a similar committee on the subject of the union of the two assemblies. In response to this, a committee of conference was appointed to ascertain whether a practicable basis of union can be found and to report to the next general assembly. It was also agreed to hold the next meeting of the assembly at Atlanta, Ga., at the same time with the meetings of the assemblies of other Presbyterian churches.

STATISTICS. Synods, 13; presbyteries, 72; congregations, 1127; licentiates, 44; students of theology, 98; communicants, 178,601, of whom 38,984 (22 per cent.) are in the mission fields in the Punjab, India, Egypt, and the Sudan. Contributions: For the boards of the church, \$579,462; for all purposes, \$2,644,848; average per member, \$18.78; average salary of pastors, \$1241; average cost of churches erected, \$9000; of parsonages, \$2971.

UNITED SHOE MACHINERY COMPANY. See TRUSTS.

UNITED STATES. POPULATION. The Thirteenth Census included statistics of population of the United States by nationalities. These were made public in 1912. For the States these figures will be found under the titles of the different States. The table given below is for the whole country. Of a total population of 91,972,266 in 1910, 68,389,104 were born in the United States and 13,343,583 were born in foreign countries. Those whose parents were both natives of the United States numbered 49,488,441. Those whose parents were both foreign born numbered 18,900,663. By race, the white population numbered 81,

732,687; negroes, 9,828,264; Indians, 265,683, and Mongolians, 142,666. The urban population was 42,623,383, and the rural population 49,348,883. The urban population in 1910 was 46.3 per cent., compared with 40.5 per cent. in 1900. The rural population in 1910 was 52.7 per cent., compared with 59.5 per cent. in 1900. The nationality of foreign-born citizens in 1900 and 1910 is given in the following table:

	1900 Number	1910 Number
Austria	275,907	1,190,200
Bohemia	156,891
Canada (English)*	784,741	1,198,000
Canada (French)*	395,066
China	81,534
Denmark	153,805	181,500
England	840,513	875,400
France	104,197	117,100
Germany	2,663,418	2,499,200
Holland	104,931	120,000
Hungary	145,714	468,500
Ireland	1,615,469	1,351,400
Italy	484,027	1,341,800
Mexico	103,393	218,800
Norway	336,388	403,500
Poland	383,407
Russia	423,726	1,577,300
Scotland	233,524	263,400
Sweden	572,014	665,500
Switzerland	115,593	124,800
Wales	93,586	82,600
Other countries	273,442

* Includes Newfoundland.

Statistics of sex distribution of population will be found in the article **SEX DISTRIBUTION IN THE UNITED STATES**. The comparative figures of illiteracy in 1900-1910 will be found in the article **ILLITERACY**. See also the article **IMMIGRATION AND EMIGRATION**.

AGRICULTURE. Statistics of agriculture relating to the United States and its dependencies will be found in the articles dealing with agriculture and agricultural products. The State production in 1911-12 will be found under the States. Statistics of foreign countries will be found under the titles of those countries. See also **AGRICULTURE**, articles on crops, and **IRRIGATION**.

MANUFACTURES. Statistics of manufactures in the separate States will be found in the State articles. The Census Bureau issued during 1912 a bulletin containing a summary of manufactures for the United States. These figures are for the calendar year 1909. The most important results of the census will be found in the table on page 745, which contains also the percentage of increase from 1904 to 1909. It will be seen from this table that the total number of wage earners in the United States in 1909 averaged 6,615,046.

The value added by manufacture in 1909, namely, the difference between the cost of materials and the total value of products, was \$8,530,261,000. This figure best represents the net wealth created by manufacturing operations, because the gross value of products includes the cost of the materials used, which are either the products of non-manufacturing industries, such as agriculture, forestry, fisheries, and mining, or else are themselves the product of manufacturing establishments. The value of products derived from this latter class of materials involves a duplication, inasmuch as the value of these materials has already figured in the value of products reported for the establishments manufacturing them in the first

instance; in some cases, indeed, where a given product has passed through several distinct stages of manufacture in different establishments before reaching its final form, this duplication may be repeated several times. All such duplications, as well as the original value of materials, are, however, eliminated in the figures for value added by manufacture. This value covers salaries and wages—which represent over one-half of the total—overhead charges, depreciation, interest, taxes, and other expenses attendant upon the manufacturing operations, as well as the profits of the undertaking.

Statistics of manufactures by industries in 1909, with the percentage of increase in the ten-year period, are given in the table below.

In this table the industries are arranged in the order of their gross value of products. Some of the industries which hold a very high rank in gross value of products rank comparatively low in the average number of wage-earners employed and in the value added by manufacture. Where this is the case it indicates that the cost of materials represents a large proportion of the total value of products, and that therefore the value added by manufacture, of which wages constitute usually the largest item, is not commensurate with the total value of products. Thus the slaughtering and meat-packing industry, which ranks first

SUMMARY FOR THE UNITED STATES FOR 1909 *

	Census 1909	1904	P. C. of Inc. 1904-'09

* In the year 1909. (a) Increase in average number of wage-earners, 1899-1909. (b) Increase in value of products, 1899-1909. † Decrease.

in gross value of products, and the flour-mill and grist-mill industry, which ranks fifth in that respect, both hold a comparatively low rank with regard to number of wage-earners or to the value added by manufacture. The blast-furnace industry, the smelting and refining of copper, the manufacture and refining of sugar

and molasses, the manufacture of butter and cheese and condensed milk, the refining of petroleum, and the smelting and refining of lead, are other industries which rank much higher in gross value of products than in the number of wage-earners or the value added by manufacture.

MINERAL PRODUCTION. A complete tabular summary of the mineral production of the United States in 1911 will be found under the title MINERAL PRODUCTION. The production of different minerals and metals in 1911 and in 1912, when available, is given under the separate headings of these articles, as GOLD, SILVER, COAL, COPPER, IRON AND STEEL, etc.

EDUCATION. For an account of educational matters in the United States in 1912 see the article EDUCATION IN THE UNITED STATES. For notes of higher education see UNIVERSITIES AND COLLEGES. For notes of educational progress in the different States see the paragraph *Education* under those States.

RELIGION. For an account of the changes and growth of the various religious denominations during the year, see the articles on the respective denominations. A summary is also given under the article RELIGIOUS DENOMINATIONS AND MOVEMENTS.

FOREIGN COMMERCE

In the tables on pages 746, 747, and 748 is given a summary of the foreign commerce of the United States for the calendar and fiscal year 1912. The summary for the calendar year 1912 is given in detail by countries. This is Table No. I. Table No. II. gives a general summary of the commerce for the fiscal year, and Tables III. and IV. give the chief articles of import and

export for the fiscal years 1911 and 1912. From the detailed summary of the calendar year given in Table No. I. it will be seen that the total foreign trade, including both imports and exports, was \$4,217,351,348, compared with a total of \$3,624,885,906 in 1911 and \$3,429,163,045 in 1910. The total foreign trade in 1912 greatly exceeded that of any other year. Of the total, \$2,399,217,993 represented exports and \$1,818,133,355 imports, leaving a balance in favor of exports, or a balance of trade of \$581,084,638. The balance of trade in 1911 was \$560,167,586 and in 1910 \$303,354,753. The total exports in 1911 were \$2,092,526,746, and in 1910 \$1,866,258,904. The total imports in 1911 were \$1,532,359,160, and in 1910 \$1,562,904,151. Of the imports in 1912, \$992,376,460 were free of duty and \$825,756,895 were dutiable. Of the foreign exports \$21,741,237 were free of duty and \$14,780,700 were dutiable.

An examination of the detailed table will show that the largest total trade, including both export and import, was with the United Kingdom. The imports from the United Kingdom in 1912 were \$312,934,838, compared with \$250,122,175 in 1911. The exports in 1912 were \$606,975,989, compared with \$538,812,316 in 1911. The European country with which trade was second in value was Germany. The imports from that country in 1912 were \$186,042,644, compared with \$165,636,669 in 1911, and the exports \$330,450,830 in 1912, compared with \$294,847,562 in 1911. Ranking next in

order of importance were France, Italy, Belgium, Netherlands, Russia, Switzerland, and Spain, in imports; in exports, France, Netherlands, Italy, Belgium, Austria-Hungary, Spain, and Russia. The imports from Canada in 1912 amounted to \$120,851,025, compared with \$93,923,757 in 1911, and the exports to Canada in 1912 amounted to \$376,162,489, compared with \$299,100,457. The total imports from South American countries in 1912 amounted to \$233,836,235, compared with \$187,456,104 in 1911. The exports to South American countries were considerably less than the imports. The total exports were \$138,944,930 in 1912, compared with \$121,736,604 in 1911. The largest import trade was with Brazil, \$132,957,326 in 1912, compared with \$103,464,111 in 1911. The export trade with Brazil in 1912 was \$40,591,519, compared with \$28,853,819 in 1911. Next in order of importance in the import trade were Argentina, Chile, Colombia, Venezuela, and Peru. In export trade Argentina stands first, with \$51,170,397, compared with \$50,140,438 in 1911. Following in order are Brazil, for which

figures are given above, Chile, Uruguay, Colombia, and Venezuela. The largest import trade with Asiatic countries, as will be seen from the table, is with Japan. This in 1912 amounted to \$87,418,042, compared with \$78,022,980 in 1911. The total trade with the British possessions in India, however, was greater than with Japan, \$97,652,386 in 1912, compared with \$79,613,519 in 1911. The total imports from China in 1912 amounted to \$35,126,226, compared with \$32,516,281 in 1911. The exports to Japan in 1912 amounted to \$57,519,854, compared with \$44,103,802 in 1911; to the British possessions, \$18,518,191, compared with \$14,403,360 in 1911; to China, \$21,040,546, compared with \$24,127,683 in 1911.

COMMERCE WITH NON-CONTIGUOUS TERRITORIES. The exports to Alaska in 1912 amounted to \$21,322,536, compared with \$14,693,588 in 1911. The imports from Alaska in 1912 were valued at \$23,385,437, compared with \$18,345,844 in 1911. The exports to Hawaii in 1912 amounted to \$28,029,240, com-

* Not including corn oil cake.

pared with \$21,917,747 in 1911. Imports from Hawaii amounted to \$50,356,851 in 1912, compared with \$47,334,271 in 1911. To Porto Rico the exports in 1912 amounted to \$33,991,022, compared with \$35,872,109 in 1911. The imports from Porto Rico were valued at \$41,183,009 in 1912, compared with \$35,138,365 in 1911. The exports to the Philippine Islands in 1912 amounted to \$24,659,150, compared with \$20,896,829 in 1911. The imports from the Philippines amounted to \$22,355,310 in 1912, compared with \$20,104,446 in 1911.

INTERNAL COMMERCE

DOMESTIC COMMERCE ON THE GREAT LAKES.

The total vessel passages through the Sault Ste. Marie Canal for the nine months ending December, 1912, were 22,778. Of these, 14,916 went through the United States canal and 7862 through the Canadian canal. The total registered tonnage of these vessels was 56,736,807 and the passengers carried numbered 66,877. The principal articles carried in this traffic were as follows: East bound—Copper, 116,954 tons; grain, 69,024,446 bushels; flour, 8,652,153 barrels; iron ore, 46,293,423 short tons; lumber, 667,542 M. feet; wheat, 174,086,456 bushels; general merchandise, 238,865 short tons. West bound—Coal (hard), 2,142,485 short tons; coal (soft), 12,789,109 short tons; manufactured iron, 629,060 short tons; salt, 660,991 barrels; general merchandise, 1,425,918 short tons.

Through the Portage Lake canals passed 1583 steamships and 697 tugs and tow barges, or a total tonnage of 2,393,856. The principal commodities carried through these canals in the nine months to December 31, 1912, were: Bituminous coal, 1,111,983 tons; wheat, 3,159,983 bushels; flour, 1,747,415 barrels; iron ore, 74,308 short tons; iron manufactures, 119,656 short tons; salt, 168,977 barrels; shingles, 183,802 M.; general merchandise, 170,689 tons. The total commerce passing through these canals was 2,428,578 tons. The traffic passing through Sturgeon Bay and the Lake Michigan Ship Canal for the season ending December 31, 1912, was 550,169 short tons. The vessels passing through numbered 2134, with a total tonnage of 1,267,695. The chief articles of traffic were coal, grain, lumber, posts, and railroad ties.

RECEIPTS AND DISBURSEMENTS. The following table, compiled from figures given by the Secretary of the Treasury, shows the receipts and disbursements of the federal government for the fiscal years 1911 and 1912:

	Receipts	
	1911	1912
Customs	\$314,497,071.24	\$311,321,672.22
Internal revenue:		
Ordinary	289,012,224.20	293,028,895.93
Corporation tax.....	33,516,976.59	28,583,303.73
Sales of public lands	5,731,636.88	5,392,796.75
Miscellaneous	58,614,466.08	53,451,796.74

The receipts and disbursements for the fiscal year ending June 30, 1913, are estimated by the Secretary of the Treasury in this annual reports as follows:

Receipts	
Customs	\$328,000,000.00
Internal revenue	297,000,000.00
Corporation tax	29,000,000.00
Miscellaneous	57,000,000.00
Total ordinary receipts.....	\$711,000,000.00
Disbursements	
Civil establishment	\$177,000,000.00
War Department	158,000,000.00
Navy Department	130,000,000.00
Indian service	18,000,000.00
Pensions	165,000,000.00
Interest on the public debt.....	22,800,000.00
Total ordinary disbursements....	670,800,000.00
Surplus for 1912 in ordinary receipts	40,200,000.00
Panama Canal disbursements.....	42,000,000.00
Miscellaneous redemptions of the public debt	150,000.00
Total estimated deficit.....	1,800,000.00

COINAGE. The coinage executed at the mints of the United States during the calendar year 1912 was as follows:

Denomination	1912	
	Pieces	Value
Double eagles.....	149,824	\$ 2,996,480.00
Eagles	705,083	7,050,830.00

* A revised estimate by the Director of the Mint of the stock of gold coin was adopted in the statement for August 1, 1907. There was a reduction of \$135,000,000.

** A revised estimate by the Director of the Mint of the stock of subsidiary silver coin was adopted in the statement of September 1, 1910. There was a reduction of \$9,700,000.

† For redemption of outstanding certificates an exact equivalent in amount of the appropriate kinds of money is held in the Treasury, and is not included in the account of money held as assets of the government.

‡ This statement of money held in the Treasury as assets of the government does not include deposits of public money in national bank depositaries to the credit of the Treasurer of the United States, amounting to \$33,261,598.08. For a full statement of assets, see Public Debt statement.

NATIONAL DEBT. The amount and classification of the United States national debt at the end of the calendar years 1910, 1911, and 1912, were as follows:

	Dec. 31, 1910	Dec. 31, 1911	Dec. 31, 1912
Interest-bearing debt at from 2 to 4 per cent. and redeemable from 1908 to 1961, inclusive	\$ 913,317,490.00	\$ 963,359,390	\$ 964,631,630.00
Debt on which interest has ceased since maturity	1,995,045.26	1,821,830	1,695,070.26
Debt bearing no interest.....	387,919,402.43	379,794,799	374,733,081.90
Gross debt	\$1,303,231,937.69	\$1,344,976,020	\$1,341,059,782.16
Cash balance in general fund.....	89,393,472.14	126,925,992	143,576,381.22
Net debt	\$1,213,838,465.55	\$1,218,050,138	\$1,197,483,400.94

ARMY

STRENGTH OF THE ARMY. On June 30, 1912, the actual strength of the regular army was 4470 officers and 77,835 enlisted men, a total of 82,305. This was an increase over July 30, 1911, of 189 officers and 7834 enlisted men. There were, in addition, Philippine scouts numbering 180 officers and 5480 enlisted men. The geographical distribution of the army, including the Philippine scouts, on June 30, 1912, was as follows: In the United States, 61,584; in Alaska, 1232; in the Philippines, regular army 10,970, Philippine scouts 5660; in China, 1256; in Porto Rico, 614; in Hawaii, 3969; in the Canal Zone, 821; troops en route and officers at other foreign stations, 1859. During the fiscal year 395 second lieutenants were appointed in the army. Of these, 177 were graduates from the United States Military Academy, 29 were from among the enlisted men in the army, and 189 were from civil life. These appointments left 134 vacancies of second lieutenantcies in the line on October 15, 1912, and 20 vacancies in the corps of engineers.

The actual strength of the army on June 30, 1912, was about $4\frac{1}{2}$ per cent. below its authorized strength. There were during the year 158,917 applicants for enlistment and reenlistment. Of these only about 25 per cent. were accepted, a smaller percentage than during the preceding year and indicating a continued maintenance of the existing standards of care of selection. The percentage of desertions was about 3 of the whole number of enlistment contracts in force during the year and rose from 2.28 for the preceding year, a percentage lower, with one exception, than in any other year during the past 90 years.

ARMY REORGANIZATION. During the year an important general scheme for army reorganization was perfected by the war college division of the general staff. This plan is the result of a system of post-graduate education which is being carried on at service schools at Leavenworth, Fort Monroe, and the war college at Washington. In general scope and purpose the plan is a constructive application to modern American conditions of the principles of military policy carefully worked out by General Upton in his exhaustive studies of military policy soon after the Civil War. The scheme is too complicate for detailed discussion in this place. A summary of its principle features, however, may be noted. It deals, first, with the general relations between the land and naval forces; second, with the relation between the land forces at home and abroad, including the detachments on foreign service; third, with the land forces within the territorial limits of the United States, including the time required to raise armies, relations of the two classes of citizen soldiers, organized and unorganized, the relation of the regular army to the nation's war power, and the joint use of regulars and citizen soldiery; fourth, the plan deals with the peace administration of the regular land forces, including the relations between the coast artillery and the mobile army and the division and administration of the forces in the continental United States; fifth, it deals with the reserve system and outlines a plan for a regular army reserve, unorganized reserves, special reserves, and reserves for the citizen soldiery. Other details considered in this plan are the tactical organization of mobile troops, the relation of promotion to organ-

ization, a suggestion as to initial tactical organization for the mobile army with a programme of gradual expansion into a field army, plans for raising and organizing the national volunteer forces, and considerations determining the strength, composition, and organization of the land forces of the United States. The final suggestion in this plan of organization concerns a council of national defense, this to include: The President; the secretaries of State, War, and Navy; the chairmen of the committees on appropriations, foreign affairs, military affairs, naval affairs, in the Senate; the chairmen of the committees on appropriations, foreign affairs, military affairs, and naval affairs in the House of Representatives; the chief of the general staff of the army; an officer of the navy not below the rank of captain; the president of the army war college; and the president of the navy war college.

There is especial need of the reorganization of foreign garrisons on account of the approaching completion of the Panama Canal and the new readjustment of conditions in the Philippines. A garrison of troops will be necessary at the canal in order that the fortifications may be properly manned and for other purposes. It is estimated by the Secretary of War that not less than 6500 should compose this garrison. The plan of readjustment of conditions in the Philippines, begun in 1911, was carried out in 1912. The former garrison of 12 regiments of infantry and cavalry at reduced strength was replaced by a garrison of 6 regiments of full strength. The six regiments which were thus relieved from Philippine service were returned to the United States and are available to furnish the Panama and Hawaiian garrisons. In addition to this reorganization of foreign troops, steps were taken during the year to organize the army within the United States on a tactical basis. Hitherto the army has been administered according to a purely geographical organization, and the mobile troops were scattered in about 40 posts situated in 24 different States, containing an average strength of less than 700 men at each post. Plans were practically completed at the end of the year under which these dissociated units will be united into a tactical organization of three infantry divisions, each consisting of two or three brigades of infantry, and so far as practicable of a proper proportion of divisional cavalry and artillery. In addition there will be several separate brigades of cavalry available for the formation of a cavalry division.

LEGISLATION. The army appropriation bill passed October 21, 1912, contained many important provisions relating to the administration of the army. It provided for the consolidation of office establishments of the quartermaster-general, the commissary-general, and the paymaster-general of the army into one bureau of the War Department, to be known as the "quartermaster's bureau"; and the consolidation of the quartermaster's, the subsistence, and pay departments of the army into a single department, to be known as the "quartermaster corps of the army." James B. Aleshire, formerly quartermaster-general, was appointed chief of the new quartermaster corps. The act also provided for a general service corps of enlisted men to do for the army such work as that of clerks, engineers, firemen, carpenters, teamsters, etc., which work was heretofore performed by a large force of civilian employees and soldiers detailed on extra duty. By a third provision of the same act the detachment of officers below the grade of major from duty with their companies, troops, or batteries was restricted under severe penalty, unless they shall have been present for duty with such organizations for at least two out of the preceding six years.

On February 15 Major-General Frederick C. Ainsworth was removed from his office as adjutant-general of the United States after 37 years of service. He entered the army in 1874 as a surgeon. General Ainsworth was removed by order of the Secretary of War, who charged him with insubordination the next day on his own application. In removing General Ainsworth, Mr. Stimson alleged that he had "impugned the fairness and intelligence of the Secretary of War, under whose authority the proposition in question [the proposal of the general staff to make changes in the form of the muster roll] was submitted to you. You also criticised and impugned the military capacity of the officers of the general staff and the war college. This is not an isolated instance of insubordination and impropriety." General Ainsworth and General Wood, chief of staff, had long been at odds on the question of the proper conduct of their respective duties.

On February 16 the House of Representatives adopted an amendment to the army bill providing for consolidation of the office of army-general and inspector-general with that of chief of staff. The House also adopted a measure abolishing five of the fifteen cavalry regiments and indorsed the action which it had taken on the previous day in advancing the terms of enlistment from three to five years. This proposal was strongly opposed by General Wood, by Secretary Stimson, and President Taft.

When this bill came to the Senate objections were made to the amendment abolishing five of the cavalry regiments, as well as to other amendments which were new legislation. A conference committee of the two houses was appointed and on May 27 the bill was again submitted to Congress. It had been greatly changed, several of the old amendments had been struck out and others even more radical had been added. One of these was made with the plain intention of preventing the further service of General Leonard Wood as chief of staff. It provided certain conditions of service under which not only General Wood but many of the other general officers who were in direct line for appointment as chief of staff would have been ineligible. The conference report was adopted by the Senate on June 10 and by the House on June 13. The President promptly vetoed the bill, largely on account of the provision relating to the chief of staff. The President's action left the War Department without funds and it was necessary for Congress to pass three special resolutions continuing the appropriation act of 1912. The appropriation bill with the objectionable elements eliminated was finally signed by the President on August 9.

THE NATIONAL GUARD. Secretary Stimson in his annual report made recommendations in regard to legislation relating to the national guard with the object of bringing these organizations under more direct control of the government when war is threatened. At the present time the use of the national guard by the

federal government is limited to the comparatively narrow functions of executing the laws of the Union, suppressing insurrection, and repelling invasion. It cannot be used outside the limits of the United States. It thus cannot be used for general military purposes. The recommendations included payment of the members of the national guard and provisions that should make it possible for the organization to be transferred and made available as a general military force, and not militia, in time of war. He urged the necessity of providing these bodies with adequate training so that they would be useful as volunteers in emergencies. He said that an attempt to use them in war as a militia would be to disregard some of the most costly and bloody experiences of our history. A militia pay bill was introduced in Congress, but no action was taken. Mr. Stimson also recommended the passage of the volunteers' bill, providing the necessary legislation under which, in time of war, a force of national volunteers can be created without delay. Even if the militia were organized as indicated above, there would be available only about 100,000 men, which would be an entirely inadequate force under serious conditions. A bill giving the government power to organize national volunteers was pending in Congress.

MILITARY OPERATIONS. The active operations of the army during the year were confined to the Philippines and to the Mexican frontier. In the Philippines there was less trouble from outlaws and from *ladrones* than in former years. The only affair of serious character was an attack made on Capt. Ephraim G. Peyton's command, Troops A and C, Second Cavalry, and Thirty-fourth and Fifty-second companies, Philippine Scouts, by a band of Moro outlaws on January 14, 1912, in the island of Jolo. One officer and one enlisted man were wounded in the engagement, and 20 Moros were found dead after the conflict.

The outbreak of the revolution in Mexico during 1912 made it necessary to patrol the frontier so as to enforce neutrality. The Second Cavalry was sent to Fort Bliss, El Paso, and the Fourteenth Cavalry to Forts Clark and McIntosh. On September 7, 1912, owing to border raids by Mexicans, formerly part of Orozco's rebel army, the Ninth Cavalry was ordered from Fort D. A. Russell to Douglas, Ariz., and the Thirteenth Cavalry was ordered to El Paso, Tex., from Fort Riley. These troops assisted in Texas in the suppression of General Reyes' attempt to instigate an insurrection against Madero's government, and later, after the passage of the joint resolution of Congress authorizing the President to prevent the importation of arms and munitions of war into Mexico, they assisted in the enforcement of that legislation, which was primarily responsible for the unsuccessful end of the insurrection led by General Orozco in Chihuahua. After the rebel forces had been broken up or scattered and were raiding the border, there was considerable active patrol duty performed by United States troops to prevent raids upon American ranches in Texas and Arizona. Brig.-Gen. Joseph W. Duncan was in command of the Department of Texas, and in charge of these operations until his death, on May 14, 1912, after which Brig.-Gen. E. Z. Steever succeeded him. At the end of the year there were on duty on the Mexican border six regiments of cavalry, a regiment and a half of infantry, a battery of field artillery,

two companies of coast artillery, and one company of signal corps troops. The approximate total strength of these troops was 6754 officers and enlisted men.

ERECTION OF COAST FORTIFICATIONS. Work continued on fortifications for the defense of Honolulu and Pearl Harbor during 1912 and it was expected that by the end of the fiscal year 1913 they would be advanced to approximately 90 per cent. of completion.

The fortifications of Subig Bay in the Philippine Islands were completed. The fortifications of Manila Bay were about three-fourths completed, and with the funds already appropriated could be advanced about 90 per cent. towards completion.

At Guantánamo, Cuba, some emplacements were provided for medium and rapid-fire guns. About \$285,000 was expended for that purpose and for the erection of structures for the mining system.

NAVY

NAVAL AIDS. The experiment of detailing four naval aids to assist the Secretary of the Navy in his conduct of naval affairs, first inaugurated by Secretary Meyer, has been so successful that Mr. Meyer in his annual report for 1912 recommended that these four aids be legalized. He said that during a trial extending over three years he had become convinced that efficient administration of the navy cannot be accomplished by the secretary without some sort of a board or council made up of expert advisers. The four aids appointed by Secretary Meyer are as follows: Aid for operations of the fleet; aid for personnel; aid for material; and aid for inspections. These officers are without executive authority, but have a supervisory function and serve in an advisory capacity. The "aid for operations" gives his entire time to the operations of the fleet. He works in conjunction with the war college and the general board on war-plans and strategical matters. The "aid for personnel" is instrumental in coördinating the work of the bureau of navigation, the bureau of medicine and surgery, the marine corps, offices of naval militia, naval reserve, aviation, radio-telegraphy, and of the judge-advocate-general. The "aid for material" acts largely as referee when differences of opinion arise between heads of the different bureaus making up the division of material. The "aid for inspections" is especially charged with the supervision of the work of the two permanent department inspection boards, the one for ships and the other for shore stations. All four aids recommend the assignments of flag officers and captains.

THE FLEETS. The vessels of the navy are divided into the Atlantic fleet, the Pacific fleet, the Asiatic fleet, the Atlantic torpedo fleet, the Pacific torpedo fleet, and unattached vessels in active service.

Throughout the fiscal year 1912 the Atlantic fleet, under the command of Admiral Hugo Osterhaus, carried on exercises, manœuvres, and fleet training. In the winter of 1911-12 the usual visit was made to Guantánamo Bay, where there was target practice and other exercises. No foreign cruises were made by the fleet during the year. One squadron of the fleet welcomed the German fleet which called at Hampton Roads and New York in June, 1912. In the latter part of May it became necessary to employ one squadron of the fleet in the

waters of Cuba and vicinity because of the disturbed conditions existing in that republic, but by the end of June conditions had so improved as to permit of the release of these vessels and their return to their usual exercises.

The Pacific fleet, consisting of two divisions of armored cruisers, three in the first division and two in the second, was until March 7, 1912, under the command of Rear-Admiral Chauncey Thomas. On that day he was succeeded by Rear-Admiral W. H. H. Southerland. The early part of the year was spent by this fleet in overhauling, docking, and target practice. But in November, 1911, conditions made it desirable for the fleet to base at Honolulu. About three and a half months were spent in the Hawaiian Islands, with Honolulu as a base. On March 18 six vessels sailed for the naval station at Olongapo, Philippine Islands, and operated in that vicinity until the latter part of June, when they crossed to China and Japan and the voyage home was started.

The Asiatic fleet, under the command of Rear-Admiral Joseph B. Murdock, throughout the fiscal year continued operations on the Asiatic station. During the revolution in China in the winter of 1911-12 very valuable services were rendered, and all available strength, including the destroyers, was concentrated in Chinese waters. Rear-Admiral Reginald F. Nicholson succeeded Rear-Admiral Murdock in July, 1912. The submarines of the Asiatic fleet made a very successful cruise to the Philippine Islands in April, 1912. The vessels of this fleet were ordered to Nicaragua during the revolution under General Mena and through their efforts order was established in that country. See UNITED STATES, *Foreign Relations*.

The Atlantic torpedo fleet of destroyers and submarines continued their valuable and instructive exercises in developing the offensive and defensive tactics of torpedo boats, working in conjunction with the Atlantic fleet whenever opportunity offered. This fleet ceased to exist as a separate organization in March, 1912, when the destroyers with their tenders were attached to the Atlantic fleet as the torpedo flotilla thereof, and nine submarines and their three tenders were constituted as the Atlantic submarine flotilla, a separate organization which will be attached to the fleet whenever joint exercises are possible.

The Pacific torpedo fleet, consisting of twelve destroyers and torpedo boats and two submarines with tenders, also carried out tactical and strategical exercises of an advanced nature and valuable information was obtained from their operations. Shortage of personnel made it necessary to place most of these vessels in reserve so that at the end of the fiscal year 1912 only one group of five destroyers remained on active service, together with two new submarines that took the place of two older ones placed in reserve.

MOBILIZATION OF THE FLEETS. The second mobilization of the Atlantic fleet took place in the North River, New York City, beginning October 14, 1912. Simultaneously there was a mobilization of the Asiatic fleet in Manila Bay, and arrangements were made to have the Pacific fleet mobilized at San Francisco. The vessels of the Atlantic fleet assembled at New York on October 14 and were inspected on the forenoon of that day by the Secretary of the Navy. In the afternoon of the same day the

1912—48

President inspected the fleet and on the following day reviewed it, as the ships passed out of the harbor in fleet formation. At this review there were 31 battleships, 4 armored cruisers, and 88 smaller vessels, representing a total displacement of 720,486 tons. There were attached to these vessels 1300 officers, 27,464 enlisted men of the navy and marine corps. Among the battleships were the *Arkansas* and the *Wyoming*, each of 26,000 tons; the *Utah* of 21,825 tons, and the *Delaware* and *North Dakota*, of 20,000 tons each. The total displacement of battleships was 478,508 tons. There were in this review 25 vessels in addition to those in the review held the previous year. Of these, 11 were completed, commissioned, and added to the active fleet since the date of the previous review.

NEW CONSTRUCTION. During the fiscal year 1912 the two largest battleships heretofore constructed were completed. These are the *Wyoming* and the *Arkansas*, each of 26,000 tons displacement and 21 knots designed speed. Each of the vessels on trial much exceeded the designed speed and they have been characterized as the fastest battleships in the world. Each carries twelve 12-inch 50-calibre guns in six turrets on the centre line, permitting all guns to be fired on a broadside. They are protected by eleven inches of the most efficient armor. They are driven by Parsons turbines with four shafts and the boilers are fitted to burn both coal and oil. They were in 1912 the largest battleships in service in any navy, in addition to being the fastest. The three battleships *Texas*, *Nevada*, and *Oklahoma* were under construction in 1912, as well as a number of smaller vessels.

The Secretary of the Navy in his annual report pointed out the necessity of a continuing annual building programme. He declared it necessary that the navy shall include a total of 41 battleships, with a proportionate number of other fighting and auxiliary vessels, in order to place the United States on a safe basis in its relation with the other world powers. The general board of the navy will recommend at the session of the Sixty-third Congress the construction of 4 new battleships, 2 armored cruisers, 16 destroyers, and a number of transports, submarines, and gunboats.

NAVY YARDS. The work of coordinating the work at the navy yards, undertaken by Secretary Meyer, continued during 1912. A uniform system of modern management has been inaugurated at these yards and a uniform system of shop stores has been formulated and put into operation. The subject of protection for yard workmen from accidents has been thoroughly investigated and instructions have been issued to all yards to bring about a monthly inspection of all shops expressly to maintain safety devices at all points showing necessity therefor. In the matter of improving and unifying the system of shop management at the yards progress has been made with a view to securing results of permanent value. In pursuance of the policy of the department of dispensing with such navy yards and stations as are not necessary, the naval stations at Pensacola, New Orleans, San Juan, Porto Rico, Culebra, and Sitka were closed during the year. The coaling stations at Frenchmans Bay, Me., and New London, Conn., were shut down with a view to ultimate abandonment and disposal of the land.

PERSONNEL. The Secretary of the Navy re-

peated his recommendations made in previous years as to the necessity of creating the rank of "admiral" and "vice admiral." At the present time no provision is made except for the lowest grade in flag rank, that of rear-admiral. The great battle fleet of the American navy is commanded by a rear-admiral and four other rear-admirals are under his orders. This is contrary to the system maintained by other great naval powers. Nineteen of the navies of the world include at least vice-admirals, nine of them admirals, and Japan, Germany, and England have admirals of the fleet, in addition.

NAVAL MILITIA. The naval militia organizations of a number of the States volunteered for active service in the fleet during the naval review in New York in October, 1912. Seventy-eight officers and 567 men of the naval militia took part in the manœuvres. These materially assisted in the movement of the reserve ships. The Secretary of the Navy urged legislation to increase the strength and efficiency of the naval militia. He also pointed out the necessity of establishing a naval reserve of 50,000 men in order to properly man ships in time of emergency.

Statistics in regard to the strength of the United States navy in comparison with the strength of foreign powers will be found in the article **NAVAL PROGRESS**.

POST OFFICE

The surplus in the administration of the Post Office Department, which for the first time was attained in 1911, was not repeated in 1912 on account of the extraordinary amount of franked matter mailed in the political primaries. This produced a deficit up to the end of the fiscal year. After its close, however, the income of the department again outstripped expenses. During the administration of Mr. Hitchcock as postmaster-general the reports of income and expense in the department indicated an aggregate saving of about \$45,000,000. During his administration 4765 new post offices were established, delivery by carrier was provided in 80 additional cities, and 3043 new rural routes, aggregating 73,191 miles, were authorized. To insure prompt and accurate handling of the mails by reason of this extended service, the force of postal employees was increased by more than 12,000.

The most notable event of the year in connection with the Post Office Department was the inauguration of the parcel post. This will be described in the article **PARCEL POST**.

POSTAL SAVINGS SYSTEM. The work of establishing postal savings depositories at presidential post offices was completed early in the fiscal year 1911. During 1911-12 the system was extended to include 4004 fourth-class post offices, as well as 645 branch offices and stations in the larger cities. At the end of the fiscal year 1912 there were 12,812 depositories at which patrons of the system may open accounts. The depositors numbered about 300,000 and the deposits amounted to approximately \$28,000,000, not including \$1,314,140, which is the sum withdrawn by depositors for the purpose of buying postal savings bonds. These bonds had been rendered particularly attractive by the announcement that the board of trustees will purchase them at their face value whenever their holders desire to convert them into cash.

The postal savings funds deposited at each post office are required by law to be redeposited in local banks. State and national banks to the number of 7357 had qualified at the end of the fiscal year as depositories for these funds. The deposits in such banks are secured by bonds aggregating \$54,000,000. Of this amount, \$37,000,000 represents municipal bonds, the market ability of which has been greatly increased by the establishment of the postal savings system. It is estimated that by the end of the fiscal year ending June 30, 1912, the gross income of the postal savings system will amount to \$700,000 and the interest payable to depositors to \$300,000. It is expected that when the deposits shall have increased to \$50,000,000 the system will be self-sustaining.

READJUSTMENT OF POSTAGE RATES. In accordance with a joint resolution passed by Congress on March 4, 1911, a commission was appointed by the President to investigate the subject of the readjustment of the postage rates. The commission included Mr. Justice Hughes of the Supreme Court, President Lowell of Harvard, and Mr. Harry A. Wheeler of Chicago. After granting an extensive hearing the commission prepared an exhaustive report and submitted it to the President on February 3, 1912. It was found that the cost of handling and transporting second-class mail was approximately six cents a pound. The recommendation of the Post Office Department that as a step toward the proper adjustment of postage charges the rate be increased from one to two cents a pound on all second-class publications, except those mailed for delivery in the county of publication, was approved by the commission. On February 22, 1912, the report of the commission was transmitted to Congress by the President, who urged favorable consideration. At the end of the year no action had been taken by Congress.

SHIPMENT OF PERIODICALS BY FREIGHT. The plan of shipping monthly, semi-monthly, and bi-weekly periodicals in fast freight trains, which was undertaken in one of the four contract sections of the country in 1912, resulted in a saving during the year of more than a million dollars. After the close of the fiscal year 1912 this method of transporting periodicals was extended to another contract section, but Congress forbade the further application of the policy in the two remaining sections.

CLASSIFICATION OF POSTMASTERS. On October 15, 1912, President Taft issued an order classifying fourth-class postmasters in the United States who had not already been classified under a previous order. In 1908 postmasters of the fourth class in the fourteen States lying east of the Mississippi River and north of the Ohio River had been placed in the classified service by executive order. These postmasters numbered about 15,000. By the executive order of October 15, 1912, over 36,000 postmasters were affected. By the terms of this order fourth-class post offices are divided into two groups, A and B. Group A embraces all post offices at which the compensation of postmasters is \$500 or more, and Group B includes all offices at which the compensation of postmasters is less than \$500. Appointments to offices in Group A are made by selecting one of three names certified by the Civil Service Commission after competitive examination. Appointments to the offices in Group B are made on the recommendation of post office in-

spectors, with the approval of the Civil Service Commission, after personal investigation by the inspectors.

FINANCIAL SUMMARY. The total revenues of the Post Office Department from all sources for the fiscal year ending June 30, 1912, amounted to \$246,744,015. The expenditures amounted to \$248,525,450, leaving an excess of expenditures over revenues of \$1,781,434. The chief source of revenue was the sale of stamps, stamped envelopes, newspaper wrappers, and postal cards. The amount received from this source was \$221,563,619. For second-class postage the revenue amounted to \$9,399,140, and for third- and fourth-class postage paid in money, to \$5,444,615. The largest expenditure was for transportation of mails on railroads, \$47,095,984; for compensation to assistant postmasters and clerks in post offices was paid \$42,484,457; for the expense of rural delivery, \$41,840,910; for city delivery, \$34,162,562; for compensation to postmasters, \$28,647,776; and for the railway mail service, \$20,711,675.

PENSIONS

A new pension act was passed by Congress in 1912, becoming operative on May 11. This act provides that any person who served for 90 days or more in the military or naval service of the United States during the Civil War, who was honorably discharged therefrom, and who has reached the age of 62 years or over, shall, upon making proof of such facts, be placed upon the pension roll and be entitled to receive a monthly pension in accordance with the following table (this act includes those who have served also in the War with Mexico):

LENGTH OF SERVICE

	90	6	1	1½	2	2½	3
Age	days	mos.	year	years	years	years	years
62....	\$13.00	\$13.50	\$14.00	\$14.50	\$15.00	\$15.50	\$16.00
66....	15.00	15.50	16.00	16.50	17.00	18.00	19.00
70....	18.00	19.00	20.00	21.50	23.00	24.00	25.00
75....	21.00	22.50	24.00	27.00	30.00	30.00	30.00

Up to June 30, 1912, 406,048 applications for pensions under this act had been received.

The total number of survivors of the Civil War on the pension roll at the close of the fiscal year 1912 was 497,263, a net decrease of 32,621. The number of survivors whose names were dropped from the roll during the year on account of death was 33,891 and the number of new names added to the roll was 1513. The number of individuals in the military and naval service of the United States during the Civil War is estimated at 2,213,365. It is therefore evident that 75 per cent. or more of those who rendered service in the Civil War are deceased. The annual death rate of the survivors is nearly 7 per cent. and the average age is approximately 71 years. In addition to the Civil War pensioners there were on the rolls at the end of the fiscal year 239 widows of the War of 1812; 1387 survivors and 2629 widows of the Indian wars; 1639 survivors and 5982 widows of the War with Mexico; 23,383 invalids of the War with Spain, and 13,757 invalids of the regular army. The total number of persons on the roll from all wars in the fiscal year 1912 was 860,294, a decrease of 51,188 during the year. The amount disbursed for pensions during the fiscal year was \$152,986,433. The total

amount paid as pensions from 1866 to 1912 is \$4,286,922,719. The total amount paid for pensions since the beginning of the government, including pensions for all wars, is \$4,383,368,163. Of this sum, it is estimated that \$70,000,000 has been paid to survivors of pensioners of the War of the Revolution. The total number of pension certificates issued during the fiscal year was 90,922. Of these, 22,777 were original applications. There were pending at the close of the fiscal year 422,464 claims for pensions. There are now no pensioners from the War of the Revolution on the pension rolls. The last widow pensioner of that war was Esther S. Damon of Plymouth Union, Vt., who died November 11, 1906, aged 92 years. The last survivor of the War of the Revolution was Daniel F. Bakeman, who died at Freedom, N. Y., April 5, 1869, aged 109 years, 6 months, and 8 days. The last surviving soldier of the War of 1812 was Hiram Cronk of Ava, N. Y., who died May 13, 1905, aged 105 years and 16 days.

PATENTS

During the fiscal year ended June 30, 1910, there were received 69,236 applications for mechanical patents, 1775 applications for designs, 195 applications for reissues, 7238 applications for trade marks, 941 applications for labels, and 362 applications for prints. There were 35,539 applications for patents granted. The number of patents expiring was 19,634. The need for a new building for the United States Patent Office becomes each year more obvious. Valuable models and papers are stored in places which have no adequate fire protection. A bill will be introduced into Congress providing for the construction of a new Patent Office building.

BUREAU OF MINES

The general purpose of this bureau is to conduct, in behalf of the public welfare, fundamental inquiries and investigations concerning the mining industry. The two phases of the industry that are of the greatest national importance are safety and efficiency, and it is with these that the bureau is chiefly concerned. The investigations conducted by the bureau during 1912 were confined mainly to two groups: The study of fuels belonging to or used by the government and inquiry into the causes of accidents in mines and the most feasible means for preventing such accidents. The first of these investigations has to do chiefly with the purchase, for the use of the government, of coal aggregating in cost about \$8,000,000, chiefly for the use of the navy. In addition to investigations of coal, the bureau tested and analyzed a large number of samples of fuel oil now used to determine the suitability of the oils for use as fuel on naval vessels or at government power plants. The investigations into the causes and means of prevention of mine accidents were continued and extended during the year, but as yet they have not progressed as far as the needs of the coal-mining industry. In order to provide facilities for exploring mines immediately after disasters, while the mines are still full of poisonous explosive gases so that an examination may be made while the evidence of the disaster is still fresh, the bureau maintains six safety stations, one each at Pittsburgh, Pa.; Knoxville, Tenn.; Birmingham, Ala.; McAlester, Okla.; Urbana, Ill., and Seat-

tle, Wash. The bureau is also equipped with seven mine-safety cars, which are provided with mine rescue and fire-fighting apparatus.

DIPLOMATIC SERVICE

There were several changes of importance in the diplomatic service of the United States in 1912. Three new ambassadors were appointed. These were Edwin V. Morgan, appointed ambassador to Brazil to succeed Irving B. Dudley, who died in 1911; Myron T. Herrick of Ohio to succeed Robert Bacon as ambassador to France, and Larz Anderson to succeed Charles Page Bryan. Whitelaw Reid (q. v.), American ambassador to Great Britain, died on December 15 and his successor had not been appointed at the close of the year. There were many important changes among the ministers to foreign countries, especially to Central and South American countries. John W. Garrett was appointed minister to the Argentine Republic to succeed John Ridgely Carter; Theodore Marburg succeeded Larz Anderson as minister to Belgium; Jacob G. Schurman, president of Cornell University, was appointed minister to Greece and Montenegro, to succeed George H. Moses; Cyrus E. Woods was appointed minister to Portugal to succeed Edwin V. Morgan, who became ambassador to Brazil; and Fred W. Carpenter became minister to Siam to succeed Hamilton King.

Among the ambassadors accredited to the United States the most important event was the announcement that James Bryce, ambassador from Great Britain, would retire and would

be succeeded by Sir Cecil Arthur Spring-Rice. Konstantin Theodor Dumba was appointed ambassador from Austria to succeed Baron Hengelmüller von Hengebar, who had served since 1902. Viscount Suteimi Chinda was sent from Japan as ambassador, succeeding Viscount Uchida Yasuya. Señor Don Manuel Calero succeeded Don Gilberto Crespo y Martínez as ambassador from Mexico. As noted in the table below, there were no ministers from the Argentine Republic, Colombia, Dominican Republic, Guatemala, Haiti, Honduras, Panama, Peru, and Siam in 1912.

FEDERAL JUDICIARY

There was one appointment to the bench of the United States Supreme Court in 1912, Mahlon Pitney (q. v.) of New Jersey received on the bench the place made vacant by the death of Justice Harlan in 1911. The Supreme Court in 1912 was made up as follows, with dates of appointment given in parentheses: Chief Justice, Edward D. White of Louisiana (1910); Joseph McKenna, California (1898); Oliver W. Holmes, Massachusetts (1902); William R. Day, Ohio (1903); Horace H. Lurton, Tennessee (1909); Charles A. Hughes, New York (1910); Willis Van Devanter, Wyoming (1910); Joseph R. Lamar, Georgia (1910); Mahlon Pitney, New Jersey (1912). The strong opposition which developed in Congress against the Commerce Court resulted in legislation which practically abolished that court after March 4, 1913. See RAILWAYS.

bald, a member of this court, is described under the section *Congress*. President Taft made one appointment in the Circuit Court of the United States, Joseph B. McPherson of Pennsylvania, who was appointed judge of the third circuit.

The most important decisions handed down by the Supreme Court are noted in various articles in the *YEAR BOOK*, notably *TRUSTS* and *RAILWAYS*.

An interesting decision because of the relation of the Court of Commerce to the Supreme Court was handed down by the latter in June. The case was that of a soap company, which had been appealed from the Commerce Court to the Supreme Court. The decision of the Supreme Court was delivered by Chief Justice White. In this he used strong language in regard to the functions of the Commerce Court. He said in the course of his opinion that "to give to the act creating the Commerce Court the meaning affixed to it by the court below would be virtually to overthrow the entire system which had arisen from the adoption and enforcement of the act to regulate commerce." The case was one in which the Interstate Commerce Commission denied the relief for which the soap company had petitioned. The commission declared that the rules of the railway concern which the soap company complained of conformed to the act regulating commerce and tended to prevent discrimination. Upon receipt of this decision the soap company appealed to the Commerce Court, complaining of the decision of the Interstate Commerce Commission. The commission challenged the right of the court to hear the complaint, inasmuch as there was no affirmative order of the commission upon which the court could pass. In spite of this, the court decided to go on and hear the merits of the case, and upon hearing them the court decided that the commission was right on the merits of the question. The soap company thereupon appealed to the Supreme Court, and this court in the decision of Justice White decided that the Commerce Court exceeded its powers in attempting to take up the question at all. Stated in brief, the point is that it is the business of the commission to administer the law and the business of the court not to enforce its conceptions of the meaning of the interstate law, but simply to decide whether the affirmative orders of the commission are contrary to law. Justice White pointed out in this decision that the purpose of creating the Commerce Court was "not to create a court with new and strange powers destructive of the previous well-established administrative authority of the Interstate Commerce Commission."

DISTRICT OF COLUMBIA

The results of the census of manufactures in the District, taken in 1910, were published in 1912. The number of establishments was 518, compared with 482 in 1904. The wage earners numbered 7707, compared with 6299 in 1904. The capital invested was \$30,553,000, compared with \$20,200,000 in 1904. The value of the product was \$25,289,000, compared with \$18,359,000 in 1904. The most important industries were those connected with printing and publishing. In these 1565 wage earners were employed and the product was valued at \$4,899,000. Other important industries were the making of bread and other bakery products, the

brewing of malt liquors, and foundry and machine shop products. Of the 7707 wage earners 828 were women. Those under 16 years of age numbered 19, of whom 18 were male. The prevailing hours of labor did not exceed 54 a week. A large proportion of the wage earners of the District are employed by the federal government in operations similar to those carried on in manufacturing establishments conducted under private ownership. These establishments numbered 11. They included four plants for engraving and printing, one for manufacture of professional and scientific instruments at the Smithsonian Institution, a naval gun factory at the United States Navy Yard, three government printing offices, and two other industries. The wage earners employed in these government industries numbered, in 1909, 10,657. The capital invested amounted to \$28,479,599.

Several bills for improvements in the District were introduced in the Sixty-second Congress. These included a new memorial bridge across the Potomac and additions and improvements to Rock Creek Park. Final action had not been taken upon these measures at the end of the year.

The commissioners of the District in 1912 were Cuno H. Rudolph (Republican), John A. Johnson (Democrat), and Major W. V. Judson (non-partisan) of the corps of engineers, United States army; secretary, William Tindall.

CONGRESS

The Sixty-second Congress convened in its first regular session on December 4, 1911. In a special session which had met on April 4, 1911, at the call of President Taft, for the immediate purpose of taking action on the Canadian reciprocity measure, the organization of both houses had been perfected and this organization remained practically unchanged in the regular session. The Sixty-second Congress presented many features of unusual interest. For the first time in sixteen years the House of Representatives was strongly Democratic, while the Senate, though nominally Republican by a majority of eight, as the result of the division of the Republicans into Progressives and Conservatives, could not be depended upon to give Republican majorities; in fact, throughout the special and regular sessions the majority of the Republican vote in the Senate was cast quite as often against measures favored by the President as for them.

The leader of the Democratic majority in the House was Oscar W. Underwood, chairman of the ways and means committee. Other Democrats who took an important part in the work of the House were: John J. Fitzgerald of New York, chairman of the committee on appropriations; Henry D. Clayton of Alabama, chairman of the Interstate Commerce Commission, and William Sulzer of New York, chairman of the committee on foreign affairs. The Republicans of the House chose James R. Mann of Illinois as leader. He declined to serve on any committee and gave his whole energy to the minority leadership. At a Republican caucus held prior to the special session he was authorized to assign to Republican members the minority places left for them on the various committees by the Democratic caucus. The most important of these appointments were those of Sereno E. Payne of New York as the leading Republican member of the ways and means

committee, and former Speaker Cannon as the chief Republican on the appropriations committee. In preparing his assignments Mr. Mann gave full recognition to the Republican insurgents of the House.

In the Senate there was no aggressive Republican leadership, due largely to the fact that the Republican forces were divided and the divisions were continually opposing each other, and secondarily to the fact that while there were many senators of ability in each wing of the party, there was none who showed the aggressive force necessary to a leader. Senator Penrose of Pennsylvania succeeded to the nominal leadership as chairman of the finance committee, formerly held by Senator Aldrich of Rhode Island, but he did not at any time assume the rôle of leader of the majority. The Democrats, too, were divided into the regular element, composed, in the main, of older senators, and the progressive element, comprising most of the newly elected senators. Senator Martin of Virginia was chosen nominal leader on the Democratic side.

WORK OF THE SPECIAL SESSION. While the special session was called by President Taft for the single purpose of acting upon the reciprocity measure the Democratic leaders took advantage of the opportunity offered them and introduced a number of tariff and other bills in addition to the reciprocity measure. The reciprocity bill was passed by the Senate on July 22, and on the following day was signed by the President. The tariff measures included bills amending the wool and cotton schedules of the Payne-Aldrich tariff, and another called the farmers' free list bill, which aimed to make up to the farmers whatever losses they were supposed to have incurred from the reciprocity measure. All these measures were vetoed by the President.

A committee was appointed to reopen the investigation into the election of Senator Lorimer. A bill providing for the direct election of senators, which was introduced into the Sixty-first Congress and lost, was reintroduced into the Sixty-second Congress and was passed by the vote of both houses. The session closed, however, before final action could be taken by a committee of conference of both houses. A bill provided for the publicity of campaign expenditures and was signed by the President. Bills providing for the admission of Arizona and New Mexico were passed and became laws. A number of investigations were authorized during the session of this Congress. Among these were: The investigation of the United States Steel Corporation; investigation of the operation of the sugar trust; investigations into the conduct of various departments of the government; investigations into the postal service, and investigation into the affairs of the Civil Service Commission.

SECOND SESSION, OR FIRST REGULAR SESSION. There were few changes in the personnel of the Senate and House when Congress reconvened in the first regular session on December 4, 1911. In the Senate, a new senator from Maine, Obadiah Gardner, took the place of the late William P. Frye. Failure to choose a senator from Colorado to succeed Senator Hughes, who died between the special and regular sessions, left the total number of members in the Senate, 91, of whom 49 were Republicans and 42 Democrats. In the House there were 390 members, of whom 227 were Republicans and one

Socialist. There was one vacancy in the membership of the House. The session of Congress preceding the Christmas holidays is usually given to the routine business and the introduction of bills. In those first days of the Sixty-second Congress, however, business of much importance was transacted before Congress adjourned for the holidays.

The President's message to Congress at the opening of the session was, as has been the custom of President Taft, devoted to a single subject. It was the notable message on the phases of the Anti-Trust statute. The President analyzed the judicial decisions and the judicial interpretations of the Sherman law, dwelling at length on the legal aspect of the question. He defended the action of the courts in the Standard Oil and Tobacco Trust cases. The President suggested the enactment of a law which would describe and denounce unfair methods. He suggested, in addition, federal incorporation under the control of an executive bureau or commission. He urged that corporations which have been incorporated with federal charters should be subjected to rigid supervision by this bureau or commission, which should also supervise the issue of stocks and bonds, and bring about effective publicity. The Pension bill, known as the Sherwood Pension Service bill, was introduced in the House on December 12 (see paragraph *Pension Bill* below). On December 20 the President sent to Congress a message dealing with tariff reform, together with a summary of the report of the tariff board. At the same time he sent a special message in which he approved the main features of the report of the national monetary commission. He renewed, at this time, his recommendation for legislation fixing tolls and the government of the Canal Zone.

The most important action taken by Congress in these first days of the session was that which led to the abrogation of the treaty of 1823 with Russia (see *Foreign Relations*). Congress reassembled after the holidays on June 3, 1912. The most important work done until its adjournment on August 26, 1912, is discussed in the following paragraphs.

RULES OF THE HOUSE. By action of the Democratic majority in the House of Representatives on February 3, the action taken in the previous Congress by which the Speaker was largely deprived of power, was, to a great extent, nullified. The most important change made in the previous session related to the calling of bills from the committee to which they had been referred. Up to the time of the change in 1910, it had been comparatively easy to allow any bill, no matter what its merits or importance, to die in committee, as if the committee was unfriendly it could refuse to report and nothing could be done. The only way in which such a bill could be called from committee was in securing the consent of the Speaker, so that, as a matter of fact, the whole question rested with the Speaker of the House and the committee which had been appointed by him. The revolt against Speaker Cannon in 1910 brought about the adoption of a rule which made it possible to let the House vote on the question whether a bill should be called from committee or not without it being necessary to obtain the consent of the Speaker. This change was brought about by the Democrats and insurgent Republicans acting in combination. When the Democrats came into

power in the House they found this rule an inconvenient one. They, therefore, on February 3, 1912, changed the procedure so that the calling of a bill out of committee cannot be secured until other business which depends on the Speaker is concluded. This makes it possible for the Speaker to prevent bills being called out and gives to that officer a portion at least of the power which he had before the rules were changed.

TARIFF BILLS. The tariff bills passed in the regular session of the Sixty-second Congress are discussed in detail in the article on **TARIFF**. Here is given only a chronological summary of the passage of these bills through Congress and their final disposition. The first measure introduced by Representative Underwood was a bill revising the steel and iron schedule of the tariff. This was passed in the House on January 29, by a vote of 210 to 109. On February 19, a bill revising the chemical schedule of the tariff was introduced and discussion was begun upon it. The bill passed the House on February 21. It was passed almost entirely by Democratic votes, only two Republicans voting for it. In the Democratic caucus held on March 1, Chairman Underwood stated that a unanimous agreement of the members of the ways and means committee had been made to the proposal to revise the tariff duties and upon a new form of income tax which was to be levied through the extension of the present corporation-tax law to individuals and copartnerships, the rate being one-per cent. on the net income of the individual or copartnership from business sources. This tax was to apply only to net incomes of over \$5000. Mr. Underwood estimated that this tax would bring in a revenue of \$80,000,000. The object of levying this tax was to offset the loss of \$53,000,000 in customs revenues on sugar, which would have resulted from the passage of the measure eliminating duty on sugar. The caucus voted to support these measures and on March 19, by a vote of 250 to 40, the House passed this bill. It had already passed on March 13, by a vote of 198 to 103, a bill placing sugar on the free list. On March 26 the President sent to the House the report of the tariff board on the cotton schedule. In this message he urged a considerable reduction of duties in this schedule. The report of the tariff board suggested such a reduction, possibly averaging 30 per cent. On March 29, Mr. Underwood introduced a bill revising the wool schedule of the tariff, and on April 2, by a vote of 129 to 92, this bill passed the House. This measure provided for a duty of 20 per cent. on raw wool, a reduction of 50 per cent. It was approximately the same as the bill which was passed by the House and Senate at the previous session, and had been vetoed by the President. This concluded the introduction of tariff bills in the House and the direct action of that body thereon. In the Senate the wool bill was brought to a vote on May 31 and was passed by a coalition of Democrats and insurgent Republicans. The bill revising the chemical schedule of the tariff, which was brought to a vote on July 3, was rejected by the Senate. On July 25, action was taken by the Senate on several of these tariff measures by a vote of 34 to 20. The annual appropriation for the tariff board, proposed by the President, was passed. All the Democratic senators, with the excep-

tion of three, voted against the appropriation. The Senate also adopted an amendment requiring the board to submit an annual report to Congress. Senator Penrose, on behalf of the finance committee, proposed a substitute for the wool bill passed by the House and the substitute was passed in the committee of the whole by a vote of 34 to 32. It was supported by the Progressives. After its passage, however, Senator La Follette moved as an amendment his bill which was passed in the previous session and was vetoed by the President. This bill passed the Senate by a vote of 40 to 26, the majority being composed of the Democrats and ten Republican insurgents. This bill made the duties 35 per cent. on raw wool and from 40 to 55 per cent. on manufactured wool. On July 26, the so-called Excise bill, which had already passed the House, was passed by the Senate by a vote of 37 to 18, those voting for it being again a combination of Democrats and Insurgents. Amendments were placed on the bill which were designed to include idle holders of stocks and bonds, and excluding labor, agricultural, benevolent, and building loan associations. Another amendment providing for a permanent tariff commission, introduced by Senator Cummins, was also attached to the bill together with a provision repealing the Canadian reciprocity measure. On July 27 the Senate passed a substitute for the House sugar bill. This bill was proposed by Senator Lodge and amendments were added to it by Senator Bristow. This bill eliminated the differential and revised the main duties on raw and refined sugar by about 16 per cent. It was passed by a vote of the united Republican senators. The bills which had been passed by both houses thereupon went to conference for the purpose of reconciling amendments made in the Senate. On August 3, however, the amendment to the wool bill, which repealed the Canadian reciprocity act, was withdrawn in the Senate. The conference report on the wool-tariff bill was accepted by the Senate on August 5 by a vote of 35 to 28 and the bill was sent to the President. It was vetoed by him on August 9 on the ground that the rates in the bill were too low and that they would be unjust to the wool growers as well as to the manufacturers and would throw thousands of employees out of work. He said, however, that he would be glad to sign a bill making whatever reductions in the tariff the report of the tariff board would permit. On August 13, the House again passed this bill over the President's veto by a vote of 174 to 80. Sixty Republicans were absent from the chamber and 21 were counted with the Democrats in the affirmative. In the Senate, however, the bill was not passed over the veto, the vote in that body being 39 to 36 against passage. The President had also vetoed the steel-tariff bill. This was passed over his veto in the House by a vote of 173 to 83, 16 Republican representatives voting for its passage. In the Senate the veto was sustained by a vote of 32 to 29 by a strictly party vote. The bill revising the cotton schedule of the tariff, previously passed by the House, was passed by the Senate on April 14. This bill was vetoed by the President. This concludes the record of tariff bills in the first session of the Sixty-second Congress.

THE ARBITRATION TREATIES. The proposed arbitration treaty with Great Britain is dis-

cussed in detail in the article **ARBITRATION, INTERNATIONAL**. The following paragraphs are a summary of the action taken by Congress. Discussion of the treaty began in the Senate on January 4, when Senator Hitchcock of Nebraska attacked the treaty, making the charge that the administration was plunging into an "entangling alliance." He declared that the plan for the nomination of commissioners to a high court of arbitration was revolutionary and dangerous. The debate continued until March 7. The chief defenders of the measure were Senators Lodge of Massachusetts, Root of New York, and Burton of Ohio. It was strongly opposed by Senator Bacon of Georgia, Senator Reed of Missouri, and others. Amendments were added which struck from the treaties the vital paragraph relating to the joint high commission, and other amendments which, to a large extent, vitiated the results of the treaty. These amendments were made by a vote of 42 to 40. The failure of the measure to pass in its original form was due practically to the vote of the Democratic senators, supported by several Progressive Republicans, and one or two of the regular Republicans. In their changed form the treaties were passed with only three dissenting votes. These were cast by Senator Lorimer of Illinois, Senator Martine of New Jersey, and Senator Reed of Missouri.

PENSION LEGISLATION. A new Pension bill was introduced in the House on January 30 by Representative Sherwood of Ohio. This was the so-called "One Dollar a Day Pension" bill, and it made provision for pensions to be paid to practically every survivor of the Civil War. This bill involved additional expenditure for pensions of about \$75,000,000. In the Senate the committee on pensions voted to report the bill unfavorably by a vote of 10 to 4. A substitute bill, or compromise measure, was suggested by Senator Smoot of Utah and was voted for by the committee by 12 to 2. This bill carried an annual appropriation of about \$24,000,000. It was passed by the Senate and after receiving some modifications in the conference committee of the two houses, was signed by the President on May 11. See **PENSIONS**.

DISPUTED SEATS IN THE SENATE. A special committee of the Senate committee on privileges and elections, appointed to reconsider the evidence in the case of Senator Lorimer of Illinois, made its report on May 20. The committee presented two reports, those of the majority and the minority. Five senators, Dillingham, Campbell, and Jones, Republicans, and Fletcher and Johnston, Democrats, joined in the report which declared that all the rules of law, judicial procedure, and justice required that the former judgment of the Senate in Senator Lorimer's favor be regarded as final and conclusive. They said that in the new investigation no additional substantial evidence had been produced. The minority members of the committee, comprising Senators Kern and Lea, Democrats, and Kenyon, Republican, asserted in their report that the new evidence was broader and more far-reaching than that which had preceded it and that it proved that at least ten of the votes cast for Mr. Lorimer were procured by corruption and that his election therefore was invalid. A vote was taken in the Senate on July 13 and by 55 to 28 the senators adopted the resolution declaring that

corrupt methods and practices had been employed in the election of William Lorimer and that his election was therefore invalid. This action was preceded by a remarkable debate of seven days, three of which were occupied by Mr. Lorimer himself, who spoke in his own defense. In the course of these speeches he denounced President Taft, Colonel Roosevelt, and many others who had opposed him, especially those connected with newspapers in Chicago, which he declared had been responsible for all the charges brought against him. This action of the Senate finally terminated the Lorimer case and at the conclusion of the vote Mr. Lorimer was no longer a senator. This left the State of Illinois with but one representative in the Senate chamber.

The committee appointed to inquire into the right of Senator Stephenson of Wisconsin to retain his seat, reported on February 28, "The majority report exonerates Senator Stephenson," and this report was accepted by the Senate.

On February 26 a resolution was introduced by Senator Reed of Missouri, calling for investigation into the election of Senator Du Pont of Delaware on the ground that his election was secured through corruption. On the following day Senator Du Pont denied the charges and a committee was appointed to investigate them and report to the Senate.

IMPEACHMENT PROCEEDINGS. There was begun in the second session of the Sixty-second Congress the unusual procedure of a trial for impeachment. This was against Judge Robert W. Archbald, a member of the United States Commerce Court. Early in the year, rumors of charges against Judge Archbald were widely circulated, and on April 25, the House of Representatives took cognizance of these allegations by sending a resolution to the President asking for any information in the hands of the executive department bearing on them. The President, on May 3, replied in a message in which he stated that in February, 1912, certain charges of improper conduct on the part of Judge Archbald had been brought to his attention by Commissioner Meyer of the Interstate Commerce Commission. These charges the President transmitted to the Attorney-General with instructions to investigate and confer with Mr. Meyer. The Attorney-General made a careful investigation of the charges, and, as a result, advised the President that in his opinion the papers should be transmitted to the committee on the judiciary of the House of Representatives, to be used by them as a basis for an investigation of the facts involved in the charges. These papers were accordingly laid before this committee. A resolution for an investigation by the committee on judiciary was at once passed in the House, and on May 7 hearings on the charges and the taking of testimony was begun by the committee in the open session and continued from day to day until June 4, 1912. At these hearings witnesses were sworn and examined and Judge Archbald was present in person and was represented by counsel in accordance with his request made to the committee. His counsel was permitted to cross-examine the witnesses.

As a result of the hearings the House of Representatives on July 11, with a single dissenting vote, which was that of a member representing Judge Archbald's district in Pennsylvania, voted to accept the articles of

impeachment prepared by the investigating committee. These articles numbered thirteen, each of which was an allegation of misconduct on the part of Judge Archbald. Article 1 declared that on or about March 31, 1911, he entered into a partnership agreement with Edward J. Williams of Scranton, Pa., for the purchase of a certain culm dump in Lackawanna county, for the purpose of disposing of this property at a pecuniary profit to themselves. It was alleged that Judge Archbald used his official position as judge of the Commerce Court to induce improperly and influence the officers of certain corporations who owned this bank to sell it for a sum much less than its actual value. It was further charged that Judge Archbald and Williams secured an option to purchase this property for \$3500, whereas it was worth, according to the appraisal of engineers, nearly \$50,000. Article 2 alleged that Judge Archbald entered into an agreement to sell stock of the Marian Coal Company to the Delaware, Lackawanna, and Western Railway Company while litigation was in progress between the coal company and the railway company and while the causes at issue between the two companies were pending before the Interstate Commerce Commission, whose decision was subject to review by the Commerce Court. It was asserted that Judge Archbald attempted to induce the officers of the Delaware, Lackawanna, and Western Railway Company to enter into an agreement to settle the case then pending before the Interstate Commerce Commission and purchase the stock of the Marian Coal Company at a highly exorbitant price. It was asserted also that it was his expectation to receive a part of the fee in the event that a settlement would be effected.

Article 3 charged that on August 11, 1911, Judge Archbald endeavored to induce the officers of the Lehigh Valley Coal Company to relinquish the right of that company to operate a culm dump containing approximately 472,670 gross tons, and that while these negotiations were in progress the Lehigh Valley Railroad Company was a party litigant in two suits pending before the Commerce Court. The coal company did relinquish these rights, and it was asserted by the committee that these were relinquished because of influence exercised upon them through Judge Archbald's position as a member of the Commerce Court.

Article 4 charged Judge Archbald with improper conduct as a judge during litigation between the Louisville and Nashville Railway Company and the Interstate Commerce Commission, which case was argued on April 2 and 3, 1911, before the Commerce Court. It was charged that on April 22, 1911, Judge Archbald wrote to Helm Bruce, attorney for the railway, requesting him to confer with the traffic manager of the road who had given material testimony before the Interstate Commerce Commission and to advise the judge whether the witness intended to give an affirmative answer as appeared from the record, or whether he intended to give a negative answer to the question propounded to him by the chairman of the commission. Bruce, after consultation with the traffic manager, advised Judge Archbald that the witness intended to give a negative answer. It was alleged that on January 10, 1912, Judge Archbald again wrote to Bruce calling attention to certain conclusions

reached by another member of the court which it was claimed refuted statements and contentions advanced in Bruce's original brief and sustaining the action of the Interstate Commerce Commission with respect to certain features of the case. In this, Judge Archbald asked Bruce whether he would still affirm the position taken in his brief and if so, upon what theory it could be sustained, assuming that the conclusions of the other member of the court were correct. This was followed by other questions concerning the testimony and replies from Bruce. On February 28, 1912, this case was decided by the Commerce Court in favor of the railway company, Judge Archbald writing the opinion of the majority which followed the views expressed by Bruce. It was charged that the Interstate Commerce Commission were given no opportunity to examine and answer the arguments advanced by the attorney for the railway company in his communication with Judge Archbald, nor were they informed that such correspondence had taken place. In the opinion of the committee this conduct of Judge Archbald was a misbehavior in office and unfair and unjust to the parties defendant in the case.

Article 5 related to the alleged negotiations with the Philadelphia and Reading Coal and Iron Company relative to a culm dump near Lorberry, Pa. It was alleged that in 1904 a two-thirds interest in an operating lease of this land was purchased by Frederick Warnke of Scranton. The land was owned by the Philadelphia and Reading Coal and Iron Company and the entire stock of this company was owned in turn by the Reading Company. Warnke's operations were carried on at a loss on account of unfavorable conditions and he applied to the Reading Company for the mining maps of the land covered by his lease. He was informed that the lease under which he claimed had been forfeited two years previous to its assignment to him and his application was therefore denied. He attempted to exchange this lease for a lease of other property owned by the company, but the officials of the company refused to accede to his request. It was alleged that in the latter part of November, 1911, Judge Archbald called upon the vice-president and general manager of the Philadelphia and Reading Coal and Iron Company and attempted to influence the latter's refusal to accede to the proposition made by Warnke. The officials of the road continued their refusal. In December, 1911, while Warnke was considering the advisability of purchasing a culm fill near Pittston, Pa., it was charged that he was advised that Judge Archbald was familiar with the title to the property and the rights of way of certain railroads through it. In pursuance of this assurance, Warnke is alleged to have consulted Judge Archbald, who advised him that the title was clear. The charge was made that he promised to pay to Judge Archbald \$500 for the information which he had received. Shortly afterwards this property was purchased by Warnke and several associates, and in March, 1911, Warnke drew a promissory note for \$500, which was delivered to Judge Archbald. The committee found that Judge Archbald was guilty of misbehavior in office in attempting to use his influence as a member of the Commerce Court with the officials of the Philadelphia and Reading Coal and Iron Company for the purpose of securing a

lease of the culm bank. It was charged also that the \$500 given in the guise of compensation for legal advice was, in fact, in the nature of a reward for favors previously shown in connection with the judge's efforts to bring about an acceptance of Warnke's proposition to the Philadelphia and Reading Coal and Iron Company.

Article 6 charged that in December, 1911, or January, 1912, Judge Archbald entered into an agreement with James R. Dainty of Scranton, Pa., to open negotiations with the Lehigh Valley Coal Company and the Everhart estate for the purpose of effecting the sale of two tracts of land near Wilkesbarre, Pa. It was charged that Judge Archbald attempted to use his official influence as a member of the Commerce Court to affect the action of the general manager of the Lehigh Valley Coal Company with respect to the purchase of this property.

Article 7 dealt with transactions relating to the discounting of a note made by W. W. Rissinger which Judge Archbald had indorsed. The latter had presided at a litigation between the Old Plymouth Coal Company and the Equitable Fire and Marine Insurance Company. Mr. Rissinger was the controlling stockholder of the plaintiff-company. The litigation ended in a compromise by which the plaintiff recovered about \$28,000. Several days after it was alleged that Judge Archbald entered into a deal with Rissinger for the purchase of an interest in a gold mining project in Honduras, and in order to finance the transaction it was claimed that a promissory note for \$2500 was signed by Rissinger and was indorsed by Judge Archbald. It was charged that an attempt was made to discount this note a few days after the settlement of the suit by compromise and the committee charged that the evidence tended strongly to indicate that Judge Archbald had entered into negotiations with Rissinger while litigation was pending before the United States District Court, of which he was judge.

Articles 8 and 9 also referred to the discounting of a note. In the fall of 1909 the case of John W. Peale against the Marian Coal Company, which involved a considerable sum of money, was opened before the United States District Court at Scranton, over which Judge Archbald presided. This coal company, which is the same as that referred to in the previous article, was principally owned and controlled by Christopher G. Boland and William P. Boland, and it was charged that this fact was well known to Judge Archbald. In the latter part of November or the early part of December, 1909, for the purpose of raising funds to invest in a timber project in Venezuela, which was being promoted by one John Henry Jones of Scranton, Judge Archbald is alleged to have drawn and indorsed a promissory note for \$500, payable to himself, which note was signed by Jones as promisor. It was charged that Judge Archbald agreed and consented that Edward J. Williams should present this note to Christopher G. Boland or William P. Boland or either of them for discount, and that the note was presented to each of them and that they refused to discount it on the ground that it would be highly improper for them to do so under the existing circumstances. After the refusal of a bank in Scranton to discount the note it was finally discounted by Jones in a Providence bank, a small State

bank in a suburb of Scranton. The president of this bank was C. H. Van Storch of Scranton, an attorney who had prevailed as a party in interest in litigation before Judge Archbald within a year prior to the date of the discount of the note. It was alleged that Judge Archbald advised Van Storch that he would consider it a great favor if the discount should be granted. The charge was made by the committee, that the note had never been paid although the bank had made, at least, one call for payment. The committee charged that Judge Archbald had used his influence as a judge to secure this loan from parties litigant before his court, and failing in this used his influence to secure the loan through an attorney who was then practicing before his court and who had but a short while before received favorable judgment in his suit adjudicated therein.

Articles 10 and 11 charged the wrongful acceptance of money by Judge Archbald on the occasion of a pleasure trip to Europe. It was alleged that he allowed Henry W. Cannon of New York City to pay his entire expenses on a pleasure trip to Europe. Mr. Cannon, it was charged, was and is a stockholder and officer in various interstate railroad corporations and corporations engaged in the business of mining and shipping of coal. While it was claimed that Mr. Cannon is a distant relative of Judge Archbald's wife, the committee declared it improper for a judge to thus obligate himself to an officer of numerous corporations likely to become directly or indirectly involved in litigation before his court, or before other courts over which he might be called to preside from time to time. It was further alleged that two officials of the United States District Court of Scranton raised a fund of more than \$500, which was presented to Judge Archbald on his departure. The contribution, it was alleged, was made by certain attorneys practicing before the United States District Court, some of whom had cases then pending before that court. The committee regarded the acceptance of this fund as improper, and held that it was subversive of the confidence of the public in the judiciary for a judge to place himself in this manner under obligations to attorneys practicing before his court. Article 12 charged that Judge Archbald, in 1901, appointed one J. D. Woodward of Wilkesbarre, Pa., as jury commissioner in the district court over which Judge Archbald presided, while Woodward was general attorney for the Lehigh Valley Railroad. The committee declared that the appointment of a legal representative of a large railroad corporation which was likely to become directly or indirectly involved in litigation before the United States District Court was misbehavior in office calculated to bring the federal judiciary into disrepute.

Article 13 dealt in a general way with the alleged misbehavior of Judge Archbald. It declared that the testimony in the whole case tended to show such misbehavior. The testimony failed to disclose any case in which Judge Archbald invested any actual money of his own in any of these enterprises, but it was alleged that it did show that he used his personal influence as a judge in consideration of which he received or was to receive his share or interest in the property or his profits in the deal.

The articles of impeachment were forwarded to the Senate, which has charge of the trial of impeachment cases, and on July 16 that body organized itself into a court of impeachment. Judge Archbald appeared before it on July 19 and was given until July 29 to prepare his answer to the articles of impeachment. On that date the Senate, sitting as a court of impeachment, received his formal answer which was, in general, a denial of all charges made against him. This concluded the proceedings of this session of Congress. Postponement of the actual trial was made until the succeeding session.

Judge Archbald was appointed United States District Judge for the middle district of Pennsylvania by President McKinley on March 29, 1901. The appointment was to last only during vacation, but after the convening of Congress he was duly commissioned a judge of the same district by President Roosevelt. He was appointed an additional circuit judge of the United States and was designated a judge of the United States Commerce Court by President Taft. The appointment was confirmed by the Senate, and he received his commission on January 31, 1911.

SIXTY-SECOND CONGRESS, THIRD SESSION. The Sixty-second Congress met in its third and last session on December 3, 1912. During the interval which had elapsed between the two sessions three senators had died, Heyburn of Idaho, Rayner of Maryland, and Nixon of Nevada. Three temporary successors were appointed to fill out the terms of these senators until other successors should be elected at the meeting of the State legislatures. Kirtland I. Perky succeeded Senator Heyburn, William P. Jackson succeeded Senator Rayner, and W. A. Massey succeeded Senator Nixon. See IDAHO, MARYLAND, and NEVADA.

In accordance with the custom which prevailed during his administration, President Taft sent his message to Congress in the form of installments. The first message sent on December 3, dealt chiefly with the foreign relations of the United States. He discussed his policy in connection with the diplomatic and consular offices and detailed the reorganization of the State Department which has taken place under his direction. He urged that the merit system be made to apply more fully in the consular and diplomatic corps. That he himself had followed out this plan as fully as possible he showed by pointing that of the ten ambassadors appointed by him, five were by promotion from the rank of minister. Of the thirty ministers appointed, eleven were promoted from the lower grades of the foreign service or from the Department of State. Of the nineteen missions in Latin America, fifteen chiefs of missions appointed were service men. The thirty-seven secretaries of the embassies were chosen for appointment after passing successfully the required examination. The President urged larger provision for embassies and legations and for other expenses of foreign representatives of the United States government. The substance of the President's allusions to foreign relations will be found in the section *Foreign Relations* in another part of this article.

On December 6 the President sent a second message, which was more in the nature of a general message than the first. His principal recommendations were the following: The plan

of currency reform outlined by the monetary commission; an amendment to the law to lessen the penalty when corporations inadvertently disobey the corporation tax law; congressional approval of the plan of army reorganization prepared by the war college; the passage of the military bill increasing compensation to militia in the field; citizenship without statehood for Porto Ricans; regulation of water power grants so that navigable streams may be improved by water power companies; the elevation of Col. G. W. Goethals, builder of the Panama Canal, to a generalship; a return to the policy of two battleships a year by appropriation for three battleships in 1913; and authority to the United States Supreme Court to make rules of procedure in common law cases in federal courts to expedite and lessen the cost of litigation. The President emphatically disapproved the project for immediate independence of the Philippines. He declared that the true course in regard to those islands is to "pursue steadily and courageously the path we have thus far followed; to guide the Filipinos into self-sustaining pursuits; to continue the cultivation of sound political habits through education and political practice; to encourage the diversification of industries and to realize the advantages of their industrial education by conservatively approved coöperative methods, at once checking the dangers of concentrated wealth and building up a sturdy, independent citizenship." He declared further that a present declaration even of future independence would retard progress by the dissension and disorder it would arouse. On December 19 the President sent a third message which was, in effect, a defense against the charge that he had been instigated by political motives in placing 36,000 fourth-class postmasters under the operation of the civil service law (see *CIVIL SERVICE* and *Post Office*, earlier in this article). The President said: "Nothing could be further from the truth. The order was made before the election and in the interest of efficient public service. I have several times requested Congress to give me authority to put first, second, and third class postmasters and all other local officers, including internal revenue officers, customs officers, United States marshals, and the local agents of the other departments under the classification of the civil service law by taking away the necessity for confirming such appointments by the Senate." In the same message the President advocated legislation permitting members of the cabinet to sit in Congress with the right of debate but without votes. He also urged the adoption of the plan of the Postmaster-General for the readjustment of the compensation allowed to railroads for carrying the mails, and he recommended the revision of the land laws to secure and regulate conservation, and legislation affecting Alaska and the registry of mineral lands. He pointed out the necessity of further pure food legislation and requested Congress to make provision for a government building at the San Francisco Panama-Pacific International Exposition. He asked also for an appropriation for beautifying Washington and the establishment of a public utilities commission at the capital and the extension of the suffrage to citizens of the District of Columbia.

The work of Congress in the first weeks of the session directly preceding the holidays is

usually more or less perfunctory. Some important measures, however, were acted upon in the first weeks of this session. The house committee on ways and means provided for hearings on tariff revision to begin January 6, 1913. By a vote of 141 to 101 the House refused to adopt the proposed rule providing for the immediate consideration of the Senate concurrent resolution favoring the purchase, by the government, of "Monticello" the home of Thomas Jefferson. By a vote of 153 to 118 the House declared that Charles C. Bowman, Rep., of the Eleventh Pennsylvania district, was not entitled to be seated, and by a vote of 181 to 118 it declined to seat his Democratic opponent, George R. McLean. Both seats were rejected on the ground of corrupt practices. Before adjournment for the holidays the House passed by a vote of 178 to 52 the Burnett bill for the regulation of immigration (see IMMIGRATION).

The Senate continued to sit as a court of impeachment in the trial of Judge Archbald. The House managers concluded their presentation of the case before the holiday recess. The Democratic senators in caucus decided that confirmation of President Taft's appointments, with the exception of those in the army and navy, would be opposed and, if possible, prevented.

CONGRESSIONAL APPROPRIATIONS. The table below shows the appropriations of Congress for the various purposes in the sessions held during 1912. It will be noted that the appropriations in the first and second sessions of the Sixty-second Congress form a somewhat smaller total than those made in the third session of the Sixty-first Congress. The total expenses of the government for 1913 are estimated by the Secretary of the Treasury at \$670,800,000 for the administration of the regular departments of the government. For the Panama Canal, \$42,000,000, and for miscellaneous redemption of the public debt, \$150,000. The total estimated deficit at the end of 1913 was estimated at \$1,800,000.

	61st Congress 3d session 1912	62d Congress 1st-2d sessions 1913

THE SIXTY-THIRD CONGRESS. The election of November 5, 1912, resulted in important changes in the Senate. Several of the best known Republican senators were defeated for renomination in the senatorial primaries and their places will be taken in the Sixty-third Congress by Democratic senators. These were Senators Curtis of Kansas, Dixon of Montana,

and Bourne of Oregon. Democratic senators who were defeated for renomination included Senators Paynter of Kentucky, Foster of Louisiana, Percy of Mississippi, Watson of West Virginia, and Gardner of Maine. Senator Gardner, who was appointed by a Democratic governor of the State to fill out the unexpired term of Senator Frye will be succeeded in the Sixty-third Congress by Edwin O. Burleigh. In addition to the senators who were defeated for renomination several retired voluntarily, declining to become candidates for another term. These were Senators Crane of Massachusetts, Guggenheim of Colorado, and Bailey of Texas. Below is given a list of the senators in the Sixty-third Congress, which includes those whose terms expire in 1915, 1917, and 1919, together with those whose election by State legislatures in 1913 was assured by senatorial primaries held in 1912. The membership of the House in the Sixty-third Congress is also given in accordance with the returns of the election of November 5. It will be noted that Illinois has no senators on this list. Senator Lorimer was deprived of his seat in the Senate and Senator Cullom was defeated for renomination. Indications were that Lawrence Y. Sherman, his successful competitor, would be elected as Republican senator by the legislature of 1913, and that James H. Lewis would be chosen as the Democratic senator.

The names of Republican senators and representatives are in Roman and the names of Democrats in italics. An asterisk following the name of a representative indicates that he served also in the Sixty-second Congress.

ADMINISTRATION

The history of Presidents Taft's administration in 1912 in its larger aspects is told in other parts of this volume. The chief interest of course centred in the presidential campaign, which is described under its title. Events which relate to the chief departments of the government and legislation will be found in other sections of this article. Other important articles which have to do directly or indirectly with the administration are TRUSTS, TARIFF, PUBLIC LANDS, and TAXATION. In this section are noted only such events as do not properly fall within any of the other logical divisions of the YEAR BOOK.

COMMISSION ON ECONOMY AND EFFICIENCY. On January 17 the President sent to Congress a message dealing with the work of the Commission on Economy and Efficiency, which was appointed in 1910 to make an investigation of the business methods of the departments of the government. As a result of the work of the commission the President informed Congress that there was necessity of a reorganization of the government departments, and the consolidation or weeding out of bureaus which performed a duplicate work. Many so-called local offices throughout the country should be abolished, and hundreds of appointees made for political purposes should be taken off the payroll. The personnel of government employees should be improved through the introduction of civil service in practically every field. The same business methods should be applied to the administration as are used in large corporations. The commission recommended the

abolition of the revenue cutter service, which would mean a saving of \$1,000,000 a year. Great savings also could be made in the handling of the mail in the various departments. It is possible to bring about economies in traveling expenses in which the government expends about \$12,000,000 a year. Tests made by the commission showed that a saving in this item alone of over half of one cent a mile could be effected. Perhaps the most radical proposal advanced by the President was that administrative officers of the government in the departments at Washington and in the field should be put under the civil service rules and be removed from the hands of politics, and that their terms of office should not be limited, as at present, to four years.

A second message on the work of the commission was sent to Congress on April 4. In this the President again urged the passage of legislation which would allow the classification of local offices in the departments of the treasury, justice, interior, post office, and commerce and labor. The President declared that the results of the inquiry had shown that the loss caused by the fact that work which should be done by one person was done by two or more amounted easily to \$10,000,000. He stated that if the postmasters of the first and second class were placed in the classified service the saving in salaries alone would amount to \$4,500,000.

President Taft continued his efforts to economize the administration of government by directing in September that all department heads should appoint representatives to confer with the Economy and Efficiency Commission. The ultimate wish of the President as stated by him was that the government should prepare a budget or proper statement of governmental incomes and expenses in accordance with the usage of other governments. The method of making appropriations which are based upon estimates submitted by the various departments under a law which makes no provision for executive review the President declared both "haphazard and wasteful." He added: "Authority is granted for the expenditure of a billion dollars each year, without any thought as to where money is coming from. This is done on the theory that there will be no deficit. . . . While the Constitution makes Congress responsible for money-raising as well as for appropriations, responsibility for borrowing has been shifted to the President, by empowering him to procure loans to meet deficits." Some time previous to this President Taft had sought to correct the method of estimating for appropriations by directing the heads of departments to send their estimates to him before they were printed, so that a certain uniformity or standard might be exercised over all of them. This order reduced the initial estimates by millions of dollars. A part of the work of the Economy and Efficiency Commission is to summarize the statements sent by the heads of departments so as to coordinate them and to bring about a statement of necessary coming expenses which will not exceed the balance in the treasury.

Such officers he declared should not be appointed by the President with the necessity of confirmation by the Senate, but upon merit. In effect, the recommendations of the President were that the government should be conducted along strictly business principles.

Measures in accordance with the recommendations of the President had been introduced in

FOUR MEMBERS OF THE HOUSE OF REPRESENTATIVES PROMINENT IN 1912

700

Congress, but no action had been taken at the end of the year.

ADMINISTRATIVE OFFICES. There was no change in the membership of the cabinet during the year. Among the minor officials Harvey W. Wiley, chief chemist of the Department of Agriculture, resigned on March 15, indicating that he was prompted to do so by conditions within the Department of Agriculture. Dr. C. L. Alsberg, chemical biologist in the bureau of plant industry, was appointed to succeed Dr. Wiley. Herbert Knox Smith, commissioner of corporations, resigned on account of his sympathy with the Progressive party and Mr. Roosevelt. He took an active part in Mr. Roosevelt's campaign and was nominated by the Progressive party for governor of Connecticut. Luther Conant, Jr., was appointed to succeed Mr. Smith. The President appointed W. M. Bullitt solicitor-general to succeed Frederick W. Lehmann, who died in 1911. On July 3 A. Piatt Andrew resigned as Assistant Secretary of the Treasury. At the same time he made public letters in which he questioned the methods of the Treasury Department and the efficiency of Secretary MacVeagh. James F. Curtis of Massachusetts was appointed assistant secretary to succeed Mr. Andrew. As the result of an act of Congress changes were made in the Department of Commerce and Labor, whereby the bureau of statistics was abolished and a bureau of foreign and domestic commerce was established. O. P. Austin retired as chief of the bureau of statistics and A. H. Baldwin was appointed chief of the new bureau.

FOREIGN RELATIONS

The year 1912 was an especially exacting period in the foreign relations of the United States. This was caused chiefly by the disordered conditions in Cuba, Mexico, and several of the Central American states. It required the highest exercise of diplomacy and caution to avoid complications involving the active participation of the United States in the affairs of those countries, and in one case, Nicaragua, the American government was forced to take an active hand.

CANADA. The relations with Canada were devoid of unusual incident in 1912.

The organization of the international joint commission created by the United States and Great Britain to adjust differences between the United States and Canada over the uses of the boundary waters was perfected early in January. On January 18 at a meeting of the American section of the commission, James A. Tawney was named chairman to succeed the late Thomas H. Carter of Montana. The other American commissioners are George Turner of Washington, and Frank S. Streeter of New Hampshire. The Canadian commissioners are Thomas C. Casgrain, Henry A. Powell, and Charles A. Magrath. Among the problems which will be considered by this commission are the application of the Lake Champlain and St. Lawrence Ship Canal Company to construct a canal wholly within Canadian territory, regulating works to be erected in the Richelieu River, which will impound the flood waters of Lake Champlain and raise the level of that lake on the American side of the line; and the application of the Long Sault Development Company for permission to construct a dam across the Long Sault in the St. Lawrence River to improve the navigation of that river and develop water power.

1912—49

On July 20 an agreement was concluded between the United States and Great Britain adopting, with different modifications, the rules and method of procedure recommended in the award rendered by the North Atlantic Coast Fisheries Arbitration Tribunal on September 7, 1910, for the settlement hereafter, in accordance with the principle laid down in the award, of questions arising with reference to the exercise of the American fishing liberties in Article I of the treaty of October 20, 1818, between the United States and Great Britain. This agreement received the approval of the Senate on August 1, 1912, and was formally ratified by the two governments on November 15. The rules and methods of procedure embodied in the award provided for determining by an impartial tribunal the reasonableness of any new fishery regulations on the treaty coasts of Newfoundland and Canada before such regulations could be enforced against American fishermen exercising their treaty liberties on those waters, and also for determining the delimitation of bays more than ten miles wide in accordance with the definition adopted by the tribunal of the meaning of the word "bays" as used in the treaty. In the subsequent negotiations between the two governments undertaken for the purpose of giving practical effect to these rules and methods of procedure, it was found that certain modifications therein were desirable from the point of view of both governments, and these negotiations finally resulted in the agreement mentioned above by which the award recommendations as modified by mutual consent of the two governments were finally adopted and made effective, thus bringing this century-old controversy to a final conclusion.

An incident occurring in connection with the presidential campaign in the United States caused considerable discussion, and not a little ill feeling in Canada (see **PRESIDENTIAL CAMPAIGN**). In the course of a speech delivered in Massachusetts, President Taft read a letter from Mr. Roosevelt in which the latter strongly approved the President's proposal for reciprocity. In the letter which the President had written asking for Mr. Roosevelt's opinion occurred the following passage: "The amount of Canadian products we would take would procure a current of business between Western Canada and the United States which would make Canada only an adjunct of the United States. It would transfer all their important business to Chicago and New York, with their bank credits and everything else, and it would increase greatly the demand of Canada for our manufactures. I see this is an argument made against reciprocity in Canada and I think it is a good one." The publication of the President's frank opinion that Canada would be only an "adjunct" of the United States if the reciprocity measure were passed, created great resentment in Canada, and it was generally conceded to have been an unwise and impolitic act on the part of the President to have given the letter to the public.

MEXICO. The conditions of disorder and revolution existing in Mexico during 1912 were the greatest source of anxiety to the administration of President Taft. Complaint received by American citizens in Mexico compelled the President on February 3 to issue a warning to President Madero to protect American interests near the border, and in the two days following four additional regiments of United

States troops were sent to the border. A request of the Mexican government to allow Mexican troops to pass through Eagle Pass at El Paso in order to reach Juarez, then in the hands of the rebels, was declined. On February 24 a regiment of United States infantry and two batteries of artillery were sent to El Paso to protect American interests near the border. In response to a complaint made by President Madero that Mexican insurgents were importing military supplies from the United States, he was informed by the State Department that such importation could not be prohibited under the laws of the United States. On March 14, however, at the request of President Taft, a joint resolution was passed by both houses of Congress, which had an important bearing on the exportation of arms from the United States.

The resolution declared that "whenever the President shall find that in any American country conditions of domestic violence exist which are promoted by the use of arms or munitions of war procured from the United States and shall make proclamation thereof it shall be unlawful to export, except under such limitations and exceptions as the President shall prescribe, any arms or munitions of war from any place in the United States to such country until otherwise ordered by the President or by Congress." Hitherto under the principles of international law, while it is forbidden to citizens of one country to prepare an expedition or raise armed forces with a view to invasion of another country, there has not been any recognized prohibition against the sale of arms in the regular course of commerce by the citizens of one country to the citizens or subjects of another, and this without any regard to the question whether the purchasers are or are not in arms against their government. Therefore, while it had been within the right of the Mexican government to seize arms intended for the insurrectionists when found within the borders of Mexico, it had not been the duty of the United States to prevent passage of arms from one country to another in the regular course of commerce. By the passage of this resolution Congress in effect took the stand that the relation of the United States to the smaller republics on this side of the Atlantic is radically different from the relation of the United States to the European countries, chiefly on account of the responsibility placed on the United States by the Monroe Doctrine. Immediately following the passage of the resolution, President Taft issued a proclamation in accordance with its provisions.

On March 24 this regulation was so modified as not to apply to the Mexican government. The situation of Americans in Mexico became so grave that on March 29 the War Department sent 1000 rifles to the American Legation in the city of Mexico for the protection of American citizens.

On April 14 the State Department sent a note of warning to President Madero. In this attention was called to the great property losses suffered by Americans in Mexico and to the personal violence which American citizens in some cases had suffered. It also stated that lives of American citizens had been taken contrary to the conditions which governed many civilized nations. In view of these facts the government gave notice that, "It expects and must demand that American life and property within the Republic of Mexico be justly and

adequately protected, and that this government must hold Mexico and the Mexican people responsible for all wanton or illegal acts sacrificing or endangering American life, or damaging American property or interests there situated." A specific demand was made for just treatment for American citizens who might be taken prisoners as participants on one side or the other of the existing disturbance, and insistence was made that they be dealt with in accordance with humanity as well as international law. A similar note was sent to General Orozco, the most prominent of the insurgent leaders. The immediate result of this note was a reply from President Madero, which was not altogether conciliatory in tone. He affirmed with some resentment the adherence of Mexico to humane principles and the rules of international conduct. He said: "The Mexican government is perfectly acquainted with its duty. Neither word nor deed warrants doubt of our sincerity or our adherence to international privileges."

The policy of President Taft in dealing with the difficult Mexican problem received almost universal commendation. The general policy which he adopted is outlined as follows in his message on foreign relations sent to Congress in December. He said: "For two years revolution and counter-revolution have distraught the neighboring republic of Mexico. Brigandage has involved a great deal of depredation upon foreign interests. There have constantly occurred questions of extreme delicacy. On several occasions very difficult situations have arisen on our frontier. Throughout the trying period, the policy of the United States has been one of patient non-intervention, steadfast recognition of constituted authority in the neighboring nation and the exertion of every effort to care for American interests. I profoundly hope that the Mexican nation may soon resume the path of order, prosperity, and progress. To that nation in its sore troubles, the sympathetic friendship of the United States has been demonstrated to a high degree. There were in Mexico at the beginning of the revolution some thirty or forty thousand American citizens engaged in enterprises contributing greatly to the prosperity of the republic and also benefiting the important trade between the two countries. The investment of American capital in Mexico has been estimated at one billion dollars. The responsibility of endeavoring to safeguard those interests and the dangers inseparable from propinquity to so turbulent a situation have been great, but I am happy to have been able to adhere to the policy above outlined, which I hope may be soon justified by the complete success of the Mexican people in regaining the blessings of peace and good order."

MAGDALENA BAY. In April the Senate adopted a resolution calling upon the President to transmit to them "any information in the possession of the government relative to the purchase of land at Magdalena Bay by the Japanese government or by a Japanese company." This resolution was introduced by Senator Lodge.

In reply to a resolution in the Senate requesting information relating to Magdalena Bay, Mr. Taft sent on May 1 a brief message, accompanied by the report of Secretary Knox. In this Mr. Knox said there was nothing on file in the department to justify any inference

that the Mexican government or the Japanese government had been "occupied with any disposition of land near Magdalena Bay, by which the latter government would acquire land there for any purpose." He said that owing to rumors in circulation the Japanese ambassador had, with the authorization of his government, made an unreserved and categorical denial of the reported purchase of land by the government or by a Japanese company, saying that his government had never directly or indirectly attempted or contemplated the acquisition of any land at Magdalena Bay for any purpose. Mr. Knox said that the rumors were due to the efforts of an American syndicate to sell the land in the vicinity of the bay to Japanese citizens. In response to a request from the owners of these lands as to the attitude of the United States government, the department had informed them that such a sale would be regretted by the government. Following this no further action had been taken by the owners as far as information had been received by the Department of State.

Following the President's message, a committee of the Senate was appointed to take evidence in relation to the matter. This committee having examined the facts reported that it found no evidence tending to show that the government of Japan was involved in negotiations concerning Magdalena Bay, and added: "It appears from the evidence that the corporations or persons who have, or claim to have, title to the lands surrounding Magdalena Bay, have made efforts to form a syndicate and to promote the sale of these lands upon the basis of the existence of some national value to a foreign nation in Magdalena Bay as distinct from any commercial value which that bay and the adjoining territory might possess. The fact that such an idea has formed the basis of negotiations between the possessors of title to land about Magdalena Bay and citizens, subjects, or corporations of a foreign power, seems to the committee on foreign relations to afford an appropriate occasion for an expression of the view of the Senate regarding this and similar cases." As a direct result of the recommendation made in the last sentence of this report, a resolution was introduced into the Senate on July 31 and was passed three days later by a vote of 51 to 4. The purpose of the resolution is to broaden or extend the Monroe Doctrine, and it reads as follows: "Resolved, that when any harbor or other place in the American continents is so situated that the occupation thereof for naval or military purposes might threaten the communications or the safety of the United States, the government of the United States could not see without grave concern the possession of such harbor or other place by any corporation or association which has such a relation to another government, not American, as to give that government practical power or control for national purposes."

CUBA. As the result of disturbances in Cuba brought about by conflict between the Veterans' Association and the administration of President Gomez (see CUBA), Secretary Knox on January 16, following reports received from the United States minister at Havana, sent the following note of warning to the Cuban government: "The situation in Cuba, as now reported, causes grave concern to the government of the United States. That the laws intended

to safeguard free Republican government shall be enforced and not defied is obviously essential to the maintenance of the law, order, and stability indispensable to the status of the Republic of Cuba, in the continued well-being of which the United States has always evinced and cannot escape a vital interest. The President of the United States looks to the president and government of Cuba to prevent a threatened situation which would compel the United States, much against its desires, to consider what measures it must take in pursuance of the obligations of its relations to Cuba."

A negro uprising in Cuba in May in protest against the failure of the government to recognize the political status of negroes in proportion to their numbers throughout the island was a source of anxiety to the American government, and on May 23, on account of threatening conditions, two battalions of United States marines were sent to protect American interests. On May 25 a fleet of nine United States war vessels with extra marines were ordered to assemble at Key West for possible service in Cuba. President Taft, however, informed the president of Cuba that the mobilization of the fleet was not intended as a step toward intervention. On May 28, 700 American marines were landed at Guantánamo, and on June 7 the battleships *Ohio* and *Minnesota* arrived at that port. This display of energy and force on the part of the American government, together with the death of General Estenoz, the leading spirit of the revolution, enabled the Cuban government to end the disorders without difficulty. That there was a feeling of bitter hostility toward Americans among certain elements in Cuba was shown on August 27, when Hugh S. Gibson, chargé d'affaires, was attacked and severely beaten in Havana. Mr. Gibson had been in conference with the Cuban cabinet, asking for the prompt payment of the Reilly claim for \$567,000 due an American citizen for the construction of waterworks at Cienfuegos. Objection was made to paying the debt, but Mr. Gibson insisted, having been instructed to do so. He declined a check offered in payment and received cash. That evening as he was entering a restaurant he was attacked and knocked down by Enrique Maza, a reporter, who resented, he said, the humiliation of Cuba. Maza was arrested, but when taken before a magistrate was discharged, although he admitted the assault. Mr. Gibson protested against the release of Maza and thereupon the latter was again arrested and was released upon a bond of \$500. The United States government then protested and Maza was arrested for a third time and sent to jail. In the meantime the Havana papers were printing columns of abuse of Mr. Gibson, attacking his public and private life. Maza was made a popular hero and subscriptions for his benefit were suggested. The government officials, however, made prompt apologies to Gibson, and on September 1 President Gomez sent a long cable message to President Taft in which he expressed regret and indignation for this assault. He promised that Maza should be justly punished and that the newspapers should be prosecuted for libel. He appealed for a friendly settlement, fearing, he said, that the United States government might be misled because of exaggerated reports.

Following the attack on Mr. Gibson, the diplomatic representatives of other governments

held a conference and sent a note to President Gomez asking what measures had been taken to protect them. The Secretary of State thereupon called together the editors of newspapers of Havana and warned them that such attacks as those upon Mr. Gibson might result in international complications. They promised to heed the warning and all but one paper ceased to abuse Mr. Gibson. President Gomez also sent his secretary to Mr. Gibson to present what was virtually an apology for the assault made upon him.

COLOMBIA. In the early part of the year the announcement was made that Secretary Knox would visit the Latin-American republics bordering on the Caribbean Sea. Shortly after, a statement was given out by General Pedro Nel Ospina, Colombian minister, and formerly commander of the Colombian army, in which he described the proposed visit of Mr. Knox to Colombia as "inopportune." He based his action on the non-acknowledgment by the State Department of a letter which, three months previous, had been submitted by him requesting an arbitration of pending questions between the United States and Colombia. In the statement referred to above he appealed the Colombian case from the State Department to the public, alleging that Colombia was the only nation with which the United States refuses to submit to an arbitral court questions referring to the interpretation of treaties. This communication of the Colombian minister was followed by his prompt recall by the Colombian government.

MR. KNOX'S VISIT. On February 23 Mr. Knox left Key West for the purpose of making this tour of visits. He was warmly welcomed on February 28 at Panama. He visited Costa Rica on March 3, Nicaragua on March 5, Honduras on March 8, San Salvador on March 11, Guatemala on March 15, Venezuela on March 22, and Havana on April 11. At all the places at which he stopped he was received with the greatest enthusiasm. It was hoped that the visit of Mr. Knox would so ameliorate conditions in Central America that the threatened disturbances in several of the countries would not take place. This hope, however, was not realized.

HONDURAS. Conditions in Honduras, which resulted largely through the failure of the United States Congress to authorize the loan negotiations for the refunding of the foreign debt by J. P. Morgan & Co., compelled the landing of marines for the protection of American property on February 9. This was the result of the act of President Bonilla in seizing a pier and a railroad which had been leased to American citizens. The Honduran government suspended all traffic on the railway, whereupon the marines withdrew after notice had been given by the United States government that Honduras would be held responsible for any violation of the rights of American citizens.

DOMINICAN REPUBLIC. During the summer of 1912 the revolution against the administration which followed the assassination of President Carceres of the Dominican Republic in 1911 brought the republic to the verge of administrative chaos. In pursuance of the treaty relations of the United States with the Dominican Republic, which were threatened by the necessity of suspending the operation under American administration of the custom houses on the Haitian frontier, it was found necessary to

dispatch special commissioners to the islands to reestablish the custom houses and with a guard sufficient to insure needed protection to the customs administration. The efforts which were made resulted in the restoration of normal conditions throughout the republic and the good offices which the commissioners were able to exercise were instrumental in bringing the contending parties together.

At a conference held in December between the United States commissioners and General Vasquez, leader of the revolutionists in Santo Domingo, it was agreed that President Victoria and the members of the council at the capital should resign at once and that a provisional government should be proclaimed, with Archbishop Nouel as president. A new cabinet was formed and assurance was given that the electoral laws would be improved and that a convention would be held to amend the constitution.

NICARAGUA. From August to November Nicaragua was in a state of revolution, which, as it imperiled the lives and property of American citizens, led to the intervention of the United States. On July 29 President-elect Mena, who had been chosen by the legislature in October, 1911, for the four years beginning January 1, 1913, headed an insurrection, in which he was joined by a part of the government troops. The ground of his action, as reported, was his insistence on assuming office without the preliminary of a popular election which had been agreed upon. Leaving the capital, Managua, he took possession of Granada and seized railway property and vessels on Lake Nicaragua which belonged to an American syndicate, whereupon the United States minister appealed to President Diaz for the protection of American citizens. President Diaz, declaring his government unable to offer the necessary protection, appealed to the United States for assistance and a body of American marines from the *Annapolis* was landed at Corinto and proceeded to Managua on August 4.

On August 11 Managua was bombarded by a body of rebels under General Zeledon, former member of Zelaya's cabinet, and many of the inhabitants and government troops were killed. On August 19 they captured Leon and cut to pieces a body of government troops numbering about 500. During the bombardment of Managua the 100 bluejackets from the *Annapolis* protected American citizens and acted as a legation guard. It had, in the meantime, become advisable to send the *Tacoma* to Bluefields, on the east coast of Nicaragua, and this vessel remained there from August 6 to October 19, a landing force of about 50 men being ashore most of the time in order to insure protection of American life and property in case of disaster. In addition, a force of 350 marines from the Canal Zone was brought north in the collier *Justin* and at once proceeded to Managua, arriving there on August 15 and reinforcing the legation guard. On August 10 the *Denver* was diverted from a projected cruise to the Mexican coast and was ordered to Nicaragua. Affairs continued to grow so serious, with increasing menace to the railroad and other American properties, that on August 21 it was decided to send an additional regiment of marines and the armored cruiser *California* to the scene. The *Glacier*, with provisions, and the *Prometheus* and *Saturn*, with coal, were also dispatched there, followed finally by the *Colorado*

and *Cleveland*, thus bringing the force to a satisfactory strength for keeping open communication with Managua and Granada, for protecting the lives and property of Americans and other foreigners, and for maintaining an adequate legation guard. On August 28 Admiral Southerland, chief of the Pacific fleet, arrived at Corinto and took complete charge of the military forces in the western part of Nicaragua, controlling the land operations of the bluejackets and marines, as well as the duties performed by the ships in patrolling the coast and preventing filibustering.

On the arrival of the *Cleveland* at Corinto on September 14 her landing force was at once sent ashore, bringing the number of bluejackets and marines ashore in Nicaragua to about 2350. These combined forces were used in opening the railroad from Corinto to Managua and their effective services assisted in restoring tranquillity to Nicaragua and in relieving the deplorable conditions of privation and hunger that resulted in several localities from the operations of the rebel forces. It became necessary to use armed force in order to dislodge a band of revolutionists from the Barranca, a fortified position consisting of two islands near Masaya, between which the railroad passes and from which the revolutionists controlled and threatened the railroad and held Masaya in a state of great destitution. A short assault succeeded in overcoming the resistance of the rebels, but in this assault four Americans were killed and five wounded. This occurred on October 4 and on the same day five marines were slightly wounded in a skirmish at Chichigalpa.

On October 6, while an American detachment was entering Leon to occupy the town, some resistance was encountered and three Americans were killed and three wounded. With the surrender of General Mena to Admiral Southerland and his deportation from the country, followed by the death of General Zeledon, the revolutionary movement quickly subsided and by the latter part of October practically normal conditions obtained throughout the country, although it was deemed prudent by the United States government to keep a considerable force ashore for the time being. The removal of the American troops began on October 25, and after December 1 there remained only the legation guard of 100 marines at Managua. In the elections of November 2 Adolfo Diaz, the provisional president, was chosen president for the four years beginning January 1, 1913, and Fernando Salorzano was chosen vice-president.

There was a considerable amount of criticism in the United States against an active American intervention in Nicaragua. President Taft in his message in December, 1912, declared that the loss of life and suffering in Nicaragua might have been averted had the Department of State, through approval of the loan convention by the Senate, been permitted to carry out its policy of encouraging the extending of financial aid to weak Central American states with the primary object of avoiding just such revolutions by assisting those republics to rehabilitate their finances, to establish their currency on a stable basis, to remove the custom houses from the danger of revolutions by arranging for their secure administration, and to establish reliable banks. He declared that the actual and immediate cause of the landing of American marines and bluejackets and their participation

in hostilities was the result of the admission of the government of Nicaragua that it was unable to protect American life and property against acts of sheer lawlessness on the part of the malcontents and its request to the United States government to assume that office. The note presented to the Nicaraguan government on December 18 by the Department of State clearly outlined the policy of the American government. It declared: "The policy of the government of the United States in the present Nicaraguan disturbances is to take the necessary measures for an adequate legation guard at Managua, to keep open communications, and to protect American life and property."

"In discountenancing Zelaya, whose régime of barbarity and corruption was ended by the Nicaraguan nation after a bloody war, the government of the United States opposed not only the individual but the system, and this government could not countenance any movement to restore the same destructive régime. . . . The revolt of General Mena in flagrant violation of his solemn promises to his own government and to the American minister, and of the Dawson agreement, by which he was solemnly bound, and his attempt to overturn the government of his country for purely selfish purposes and without even the pretense of contending for principle, make the political rebellion in origin the most inexcusable in the annals of Central America. The nature and methods of the political disturbances, indeed, place them in the category of anarchy rather than ordinary revolution."

FRIENDLY RELATIONS. Not all the relations of the American government with Central and South American countries were of an aggressive nature. The government took part in several arbitrations and mediations and through the efforts of American diplomacy wars were prevented. In association with the Argentine Republic and Brazil a successful mediation was concluded between Peru and Ecuador. A boundary dispute between Panama and Costa Rica was settled through peaceable arbitration by the United States. Threatened war between Haiti and the Dominican Republic was stayed. The government of the United States was thanked for its influence toward the restoration of amicable relations between the Argentine Republic and Bolivia. In the disagreements between the governments of Chile and Peru on account of the famous Tacna-Arica dispute the United States government exerted her friendly influence and pacific counsel.

CHILE. In the last part of August a payment was made of the long drawn-out Alsop claim, which for years has occupied the attention of the governments of the United States and Chile and at one time threatened friendly relations between the two countries. The claim arose through the loss suffered by the firm of Alsop & Company, doing business in Peru, Bolivia, and Chile before the war between these three countries. The company complained against the three governments and Bolivia and Peru made settlements, but Chile would not do so on the ground that the claim had to do with certain lands which, in the meantime, had been ceded by Bolivia to Chile. Alsop & Company thereupon appealed to the United States government. Arbitration at The Hague was suggested, but this was not agreed to by the Chilean government. It was finally agreed to refer the claim to Edward VII., as arbitrator,

and on his death the dispute was submitted to his successor, George V. In August, acting on the report of the commissioners whom he designated to study the case, King George pronounced his award, assigning a sum about one-third as much as the original amount of the claim to the Alsops in full settlement.

EUROPE. With the countries of Europe the relations of the United States were pleasant and amicable during 1912. Under a special agreement entered into between the United States and Great Britain on August 18, 1910, for the arbitration of outstanding pecuniary claims, a schedule of claims and the terms of submission were agreed upon by the two governments, and together with the special agreement were approved by the Senate on July 19, 1911, but in accordance with the terms of the agreement they did not go into effect until confirmed by the two governments by the exchange of notes, which was done on April 26, 1912. At the end of the year negotiations were still in progress for a supplemental schedule of claims.

The wars in the Near East during 1912 made it necessary for the dispatch to Turkish waters of a special service squadron consisting of two armored cruisers.

No action was taken by Russia as a result of the abrogation of the treaty of 1832 in December, 1911. This treaty was abrogated as the result of alleged discrimination toward American citizens of Jewish birth who wished to visit and travel in Russia. Under the terms of the treaty the American government maintained that the action of Russia in preventing the entrance of American citizens of Jewish birth into that country was contrary to the terms of that treaty.

CHINA. The political disturbances in China in the autumn and winter of 1911-12, which resulted in the abdication of the Manchu rulers and the formation of a provisional republican government, occasioned some anxiety for American citizens in China. In view of the seriousness of the disturbances and their general character, the American minister at Peking was instructed at his discretion to advise American citizens in the affected districts to concentrate at such centres as were easily accessible to foreign troops or men-of-war. Nineteen American naval vessels were stationed at Chinese ports and other measures were taken for the protection of American interests. The American government, in common with the other great powers, took no active part in the Chinese affairs, on the assumption that independent action by foreign governments in their own individual interests would add further to a situation already complicated.

On February 3 Secretary Knox forwarded to the German ambassador an important communication relating to the policy of foreign nations in China. After calling attention to the unanimous action of the powers thus far shown, he said: "It is therefore evident to this government that all the powers have up to the present, by common consent, not only refrained from independent action and from intervening in China's internal affairs, but have acted in full accord with their mutual assurances that they would respect its integrity and sovereignty.

"There happily has thus far been no reason for interference on the part of foreign powers, inasmuch as both imperialists and republicans

have guaranteed the lives and property of the foreign population, and the latest reports tend to strengthen the belief that it is improbable that future developments will necessitate such interference. If, however, contrary to all expectations, any further steps should prove necessary, this government is firm in the conviction that the policy of concerted action after full consultation by the powers should and would be maintained in order to exclude from the beginning all possible misunderstandings.

"Moreover, this government has felt it to be a corollary of the policy of strict neutrality hitherto pursued by common accord with respect to loans to China to look with disfavor upon loans by its nationals unless assured that such loans would be of neutral effect as between the contending factions, as it has also felt that the present was an occasion where there might be invoked with peculiar appropriateness the principle of the lending governments deterring their nationals from making loans not approved as to their broad policy by their own governments in consultation with the other interested powers."

The action is said to have been taken on account of the discovery by the German secret service that Japanese troops had been mobilized on the Manchurian frontier.

The Chinese Republic had not been recognized by the United States government at the end of the year. The Chinese loan, participation in which was attained for American capital by prompt and effective action on the part of American officials, was not consummated in 1912, as it had up to the end of the year proved unacceptable to the provisional government. The loan agreement was promulgated in June, 1912, and it included representative banking groups of the United States, France, Germany, Great Britain, Japan, and Russia. See **CHINA**, section *History*.

JAPAN. The death of the Mikado of Japan made it necessary for the United States government to send a representative to the funeral, and in August Mr. Knox, Secretary of State, was created special ambassador to Japan, charged with the mission of bearing to the imperial family, the government, and the people of that empire a sympathetic message of the American commonwealth on the occasion of the death of the emperor. The kindly reception everywhere accorded to Mr. Knox showed that his mission was deeply appreciated by the Japanese nation.

LIBERIA. As the result of the efforts of the United States government to place the government of Liberia in a position to pay its outstanding indebtedness and to maintain a stable and efficient government, negotiations for a loan of \$1,700,000 were successfully concluded and it is anticipated that the payment of the old loan and the issuance of the bonds of the 1912 loan for the rehabilitation of the finances of Liberia will follow early in 1913, when the new receivership will go into active operation. This receivership will consist of a general receiver of customs, designated by the government of the United States, and three receivers of customs designated by the governments of Germany, France, and Great Britain, which countries have commercial interests in the republic of Liberia.

For treaties negotiated with foreign countries during 1912, see **ARBITRATION**, **INTERNATIONAL**.

UNITED STATES CENSUS. The Census Bureau continued the collation of statistics gathered in the Thirteenth Census, and published many bulletins containing the results during the year. The census covered four main branches: Population, agriculture (including irrigation), manufactures, and mines. The results relating to these subjects are published first in the form of advance bulletins, which appear from time to time as the data relating to any given topic or any given State become available. Abstract bulletins will be issued relating to the four main branches. State bulletins will be issued only for the three subjects. Up to the end of 1912 there had been issued under the main subject of population an abstract of statistics of the number and distribution of the inhabitants of the United States; abstracts of race nativity, parentage, sex, State of birth, and males of voting age and militia age; abstract of statistics of school attendance and illiteracy; an abstract of statistics of age and marital condition, and an abstract of statistics of country of birth. In the branch of agriculture there had been issued abstracts of statistics of farms and farm property, statistics of livestock on farms and elsewhere, statistics of crops for 1910, statistics of tenure, mortgage indebtedness, color and nativity of farmers and size of farms, and statistics of livestock products. Under irrigation there had been issued an abstract of the statistics of irrigation. In the branch of manufactures there had been issued an abstract of statistics of manufactures for States and by industries, and in the branch of mines an abstract of the statistics of mining industries. Statistics relating to each of the States, giving data in all the four main branches, had also been issued. In addition, several special bulletins had been prepared. These related to population and gave the population of counties and equivalent subdivisions, the total population and area by States and Territories, and the population of cities. The data and text published in advance bulletins and the abstract and special bulletins will be brought together in the final reports of the census. Because of the size and number of the volumes the distribution of complete sets will be necessarily restricted. They will be sent generally to important libraries and institutions of learning, and to certain selected social, civil, industrial and economic associations, and to persons engaged in statistical research work or having special occasion to use detailed results of the census for all States covering any one or all main branches of the census.

The general statistics of agriculture for the United States will be found in the article **AGRICULTURE**. Statistics of manufactures in the States will be found in the articles on each of the States. A summary of the manufactures of the United States is given in the article **UNITED STATES**. A brief summary of the foreign-born population of the different States will be found in the paragraph *Population* in the articles on the different States. General statistics of mining are covered in the article **MINING INDUSTRY**. Data on illiteracy and statistics relating to sex distribution in the United States will be found under the respective titles.

COST OF THE CENSUS. The annual report of E. Dana Durand, director of the census, for the fiscal year ending June 30, 1912, shows the total expenditure from July 1, 1909, to June 30, 1912, to be \$15,171,593, of which \$7,223,385 was ex-

pendent for field work, including the salaries of supervisors and enumerators; \$6,271,446 for compilation and publication of statistics, and \$1,676,762 for annual and other investigations of the permanent bureau not connected with the decennial census. The total census force on December 31, 1912, numbered 813, with 740 additional special agents stationed in the southern States to collect statistics of cotton.

UNITED STATES MILITARY ACADEMY. The enrollment in the academy on September 1, 1912, was 538, and the faculty numbered 138. The changes in the faculty during the year included the retirement of Professor Samuel E. Tillman of the department of chemistry and the appointment of Professor Wirt Robinson as his successor. Professor Charles W. Larned (q. v.) of the department of drawing died June 19, 1911, and Professor Edwin R. Stuart was appointed to succeed him in this chair. The superintendent in 1912 was Col. C. P. Townsley.

UNITED STATES NATIONAL MUSEUM. The United States National Museum, the legal depository of all national collections, is a museum of record, research, and education. It is especially rich in the natural history, ethnology, and archaeology of America, but has also very extensive collections pertaining to the zoölogy, botany, geology, paleontology, archaeology, and ethnology of other parts of the world. All the natural history collections, including those of anthropology and archaeology, are contained in a new building, recently completed at a cost of \$3,500,000. The National Gallery of Art is also temporarily housed in this building. The larger portion of the older museum building is occupied by the collections and exhibits of the industrial arts. It also contains extensive exhibits illustrative of American history, including many unique objects of national importance and interest, and collections of laces and embroideries and other art textiles. The main hall of the Smithsonian building contains comprehensive exhibits of graphic arts.

The publications of the National Museum consist of the Proceedings, the Bulletins, and the Annual Reports. The first two of these series are devoted mainly to technical articles on various branches of science, based on, or descriptive of, the collections of the museum. In 1912 the museum was open to the public on Sundays. This measure has been long advocated for all the buildings, but as yet the practice concerns only the new building.

In the fiscal year ending June 30, 1912, the additions to the collections of the museum comprised about 238,000 specimens and objects, of which about 168,000 were biological, 63,000 geological and paleontological, and 7000 anthropological.

A large number of valuable temporary additions, in the form of loans, were made to the National Gallery of Art, to the collections of art textiles and to the division of history.

UNITED STATES NAVAL ACADEMY. The enrollment in the academy in the autumn of 1912 was 785. Among the additions to the academy for the academic year 1912-13 were the following: Commander H. O. Stickney was appointed head of the department of marine engineering and naval construction; Lieutenants T. F. Caldwell and J. G. H. Bowdley were appointed assistants in mathematics and mechanics; Lieutenant G. F. Neal was appointed assistant instructor in physics and electrical

engineering; Lieutenants E. G. Oberlin and I. C. Schulte were appointed instructors in the school of marine engineering; and First Lieutenant A. A. Cunningham and Second Lieutenant B. L. Smith were appointed to aviation duty at the engineering experiment station. The superintendent is Captain John H. Gibbons, U. S. N., and the commandant is Commander G. W. Logan, U. S. N. The productive funds of the academy amounted to \$625,720. The library contained 63,261 volumes.

UNITED STATES STEEL CORPORATION. The year was an eventful one for this concern. Early in the year a committee of the House of Representatives under the chairmanship of Representative Stanley began an extensive investigation into the organization and methods of the trust. On May 6, hearings were begun in the suit of the United States government to dissolve the corporation. Evidence was being taken in this case at the close of the year. The reports of the Stanley committee were not submitted to the House, but various bills were recommended by members of the committee. One of these, approved by 4 of the 5 members, would make the control of 30 per cent. of an industry presumptive evidence of unlawful restraint of trade; and would place upon the corporation the burden of proving its innocence. There were four other bills all favoring federal control and regulation with variations, some of them approving the proposal to empower the government to fix maximum prices. None of these bills were acted upon.

EARNINGS. A statement issued December 18 showed that the capacity of the corporation had increased from 7,700,000 tons in 1901 to 14,200,000 in 1912. The production had increased from 8,187,000 tons in 1902 to about 12,300,000 tons in 1912. Nevertheless the net earnings had fallen from \$133,300,000 in 1902, or an average of \$16.25 per ton, to \$108,000,000, or an average of \$8.86 per ton, in 1912. The ratio of net earnings to tonnage output had declined steadily from \$15.24 in 1907 to \$11.00 in 1911. The statement declared that about \$500,000,000 had been spent in new construction and acquisitions, almost all of which had been met from surplus earnings. Thus the fixed charges represented by preferred dividends and interest remained about the same as at the time of organization. The decline of net earnings in spite of an increase of 50 per cent. in production was explained by advanced wages, increased taxation, the profit-sharing and pension systems, and lower prices of steel. It was claimed that the advances in wage rates added between \$20,000,000 and \$30,000,000 to the pay-roll per year; that taxes paid had risen from \$2,391,000 in 1902 to about \$10,000,000 in 1912; and that welfare work was costing nearly \$5,000,000 a year.

LABOR CONDITIONS. Ever since the Pittsburgh Survey the conditions of labor in the plants of the corporation have been given a great deal of public attention. The points about which public discussion centred were the seven-day week, with a long shift of twenty-four hours when night and day shifts changed; the twelve-hour day; speeding of the workmen by bonuses to superintendents and foremen and a system of rate-cutting of piece-wages; and the repression of the men by an autocratic rule which destroyed initiative and capacity for good citizenship. In 1910, Mr. Charles M. Cabot of Boston began a movement to secure an investi-

gation of labor conditions. Such an investigation was authorized in April, 1911. Mr. Cabot also sought the privilege of mailing to each of the 15,000 stockholders copies of an article by Mr. John A. Fitch, who had investigated labor conditions in the Pittsburgh Survey. Judge Gary refused to give Mr. Cabot a mailing list of the stockholders and the matter was taken into the courts. Before final decision was made, however, an agreement was reached on the basis of which letters from Judge Gary and Mr. Cabot, together with a twenty-page pamphlet by Mr. Fitch, were mailed to the stockholders in March, 1912.

Meanwhile an investigation by a stockholders' committee had been authorized by Judge Gary. This committee made a ten-days' tour of the mills in April. It found that, with the exception of two or three plants, the seven-day week had been discontinued. With reference to the twelve-hour day, it found that 25.7 per cent. of the 175,700 workmen were employed twelve hours per day. In the rolling mills, open hearths, and blast furnaces the number of employees working twelve hours varied from 50 to 60 per cent. The committee pronounced this long day bad from the standpoints both of the individual worker and of society. As to speeding, though the committee favored retention of the bonus system and piece-wages, it favored the introduction of means for checking those officials guilty of imposing excessive strain upon their men; and it favored also the distribution of bonuses to all workers rather than to foremen and superintendents only. The repression of the workers was found to be due largely to the policy of the corporation toward unionism. The committee did not pronounce itself in favor of the restoration of union conditions, but expressed a hope that the day might come "when employer and employees shall enter into a common administration of industrial interests." The finance committee of the corporation, headed by Judge Gary, took steps toward the complete elimination of the seven-day week and the long 24-hour turn. It also determined to reduce the 12-hour day in so far as was "reasonable, just, and practicable."

Early in the summer Congress passed an eight-hour law which applied extensively to steel companies, especially as regards armor-plate. See *LABOR LEGISLATION, Hours*.

The report of the Stanley committee gave considerable attention to labor conditions. The majority report showed that the increase in the average daily wage from \$1.89 in 1902 to \$2.09 in 1909 had been attended by a decline in labor-cost per ton from \$1.25 in 1902 to 82 cents in 1909. It criticised with great severity the hours and wages of steel laborers and condemned the company for its apparent favor for foreign labor and its attitude toward unions.

Finally there was much unrest among the steel workers themselves. Two brief strikes occurred in various plants at Pittsburgh, both by unorganized laborers. At the same time representatives of the American Federation of Labor and of the Industrial Workers of the World carried on open and vigorous campaigns of organization. The presence of the latter caused general public uneasiness. The federation's plan was systematic and thorough-going. It was to culminate in simultaneous meetings of the workers in the steel mills of the entire country at the same time to effect general organization and prevent the playing of one mill

against another or one company against another by the associated employers.

For the betterment programme of the corporation, see WELFARE WORK.

UNIVERSAL PEACE CONGRESS. See ARBITRATION, INTERNATIONAL.

UNIVERSALISTS. The most distinctive tenet of this denomination is the final salvation of all men. According to statistics gathered by Dr. H. K. Carroll, there were in 1912 51,716 communicants, 709 churches, and 702 ministers. The Sunday schools have a membership of about 50,000 and the value of church property is about \$12,800,000. The denomination carries on foreign mission work in Japan and China and sustains domestic missions in fifteen churches. Its institutions of higher education include Tufts College at Medford, Mass.; St. Lawrence University at Canton, N. Y.; Buchtel College at Akron, O., and Lombard College at Galesburg, Ill. The next session of the general conference of the denomination will be held at Chicago, Ill., in October, 1913.

UNIVERSITIES AND COLLEGES. ATTENDANCE. For the year ending June, 1911, 581 universities, colleges, and technological schools reported to the commissioner of education 111,449 men and 61,265 women in collegiate and 7577 men and 3281 women in resident graduate work. This was a total of 183,572 students. Thirty-seven per cent. of these were enrolled in the 89 public institutions. Five institutions enroll more than 10 per cent. of the entire number of students. These institutions (Columbia, California, Harvard, Cornell, and Chicago) have 28 per cent. of the total endowment, 16 per cent. of the books, and about 14 per cent. of the scientific apparatus of all colleges, universities, and technological schools in the United States. They have nearly 10 per cent. of all the collegiate instructors and grant more than 20 per cent. of the scholarships. In the professional departments of universities, colleges, and technological schools there were 36,275 men and 1389 women. The five States having the largest number of students in these institutions are New York, 26,458; Illinois, 22,300; Massachusetts, 16,458; Ohio, 15,687, and Pennsylvania, 15,270. Eighty per cent. of the resident graduate students are in the Eastern Atlantic and Northern Central divisions of States. The following table, which shows the registration in twenty-eight of the leading institutions on November 1, 1912, and on the corresponding date for 1911 was prepared from data gathered by Professor Rudolph Tombo, Jr. (*Science*, December 27, 1912):

Attendance		Attendance	
Institution	Nov. 1 1912	Institution	Nov. 1 1911
California	6457	Northwestern	3632
Chicago	6351	Ohio State	3608
Columbia	9007	Pennsylvania	4843
Cornell	5412	Pittsburgh	1833
Harvard	5729	Princeton	1568
Illinois	4315	Stanford	1670
Indiana	2234	Syracuse	3529
Iowa	1944	Texas	3016
Johns Hopkins	1088	Tulane	2249
Kansas	2403	Virginia	799
Michigan	5620	Washington	2265
Minnesota	5063	University	958
Missouri	2871	Western	1378
N. Y. Univer.	4543	Reserve	5141
		Wisconsin	3265
		Yale	3224

The following table shows the number of professional schools reporting to the Bureau of Education in 1911, the number of students, the graduates, and the percentage of students who were college graduates in 1905 and in 1911:

Class	Schools	Students	Graduates		P. C. students with deg.	
			1911	1905	1911	1911
Theology	193	10,834	1,877	34.9	30.2	
Law	116	19,615	3,901	22.0	21.3	
Medicine	122	19,146	4,048	11.4	10.3	
Dentistry	55	6,961	1,764	2.5	1.7	
Pharmacy	77	6,131	1,743	1.5	1.4	
Vet. Medicine	21	2,571	706	1.1	.7	

Schools of dentistry show an increase of students over the previous year amounting to over 6 per cent. There was also a slight increase of students of law. There was a decrease in schools of veterinary medicine of 5 per cent., and small decreases in both theology and pharmacy. The most pronounced decline was in the schools of medicine. The number of students decreased by 2248, or 11 per cent. Thirteen medical schools closed their doors during the year. The largest number of medical students ever enrolled in American institutions was in 1903, when there were 27,062. The registration in 1910-11 was 19,146, showing a decline of over 36 per cent. in 8 years. This decline is due to several causes, chief of which has been overcrowding of the profession and the thorough exposure of the methods and low standards of certain medical schools by the report on medical education issued by the Carnegie Foundation. It has been claimed that the schools are raising their standards. If this were true, it ought to appear in an increased percentage of college graduates among the students, but there was a somewhat smaller percentage of such students in 1911 than in 1905. During these years students seem to have been about equally successful in pursuing their work, for there has been a decrease of less than half of 1 per cent. in the ratio of students to graduates. The decline of college graduates among the students of the professional schools is noteworthy. It has been greatest among the theological schools, but it is evident in all.

The variation in the per capita investment in the different professional schools based on student registration is remarkable. For each student in theology there is invested in grounds and buildings in round numbers \$2000, ten times the per capita investment for law students, twice the investment for each student in medicine, and nearly twice the per capita investment for grounds, buildings, scientific apparatus, and dormitories in colleges and universities. For each student in pharmacy, dentistry, and veterinary medicine there is invested respectively \$338, \$280, and \$250.

RESOURCES. Productive funds aggregating \$299,347,272 were reported by the 581 universities, colleges, and technological schools, including colleges for women, for 1911. Their scientific apparatus, machinery, and furniture were valued at \$38,289,589, buildings at \$194,183,339, dormitories at \$31,099,277, and grounds at \$81,053,420. The total receipts for the year, exclusive of addition to endowment, were \$80,902,571. Of this amount \$18,493,120 was from tuition and other educational sources, \$13,293,446 from productive funds, \$14,707,243 from State and city, \$3,469,739 from private bene-

factors for current expenses, and \$5,875,185 from the United States government. There was received for endowment, \$13,769,870. From 1900 to 1911 the productive funds of these institutions increased 93 per cent., but the income from them was increased 108 per cent., which shows that the funds are invested and managed to better advantage than in 1900. The rate of tuition has not been greatly changed. The increase in students since 1900 has been 66 per cent., the increase in amount received from tuition 73 per cent. Buildings and grounds are more economically employed, for while the increase of students as stated was 66 per cent., the increase in value of buildings and grounds was only 48 per cent. During these 11 years the total income of these institutions has increased 235 per cent., the value of scientific apparatus, machinery, and furniture 126 per cent., the number of volumes in the library 80 per cent., but the number of scholarships and fellowships has not kept pace with the increase in students. The number of scholarships increased 45 per cent., and fellowships 35 per cent.

DEGREES. The total number of degrees conferred on examination during 1910-11 was 27,319, of which men received 18,524 and women 8106. The total includes 2520 post-graduate degrees. Fifty-three per cent. of the first degrees were bachelor of arts, 26.5 per cent. bachelor of science, and 4.6 per cent. bachelor of philosophy. In 1900, 56 per cent. were bachelor of arts, 21 per cent. were bachelor of science, and 8 per cent. bachelor of philosophy. A considerable specialization is shown in the number of degrees granted in the different States. Massachusetts leads in the number of bachelor of art degrees; Pennsylvania in the number of bachelors of science; Connecticut in the number of bachelors of philosophy; New York in the number of civil and mechanical engineering degrees, and Ohio in electrical engineering degrees.

A complete list of the doctorates conferred on examination by American universities in 1911-12 was printed in *Science* (August 2, 1912). There were 492 such degrees, showing a gain of 55 over the previous year. The eight universities conferring the largest number of doctor's degrees were, Columbia 81, Chicago 57, Harvard 41, Pennsylvania 34, Cornell 33, Johns Hopkins 32, Yale 31, and Wisconsin 27. It will be noticed that these eight institutions conferred more than two-thirds of all the doctorates. Two hundred and seventy-three of the degrees were in the natural and exact sciences. Degrees in these subjects are increasing more rapidly than in other subjects. Seventy-eight doctorates were given in chemistry, 34 in English, 30 in physics, 30 in botany, 29 in psychology, 26 in economics, and the others were distributed among 33 subjects.

BENEFACTIONS AND APPROPRIATIONS. The commissioner of education reports an aggregate of gifts and bequests, excluding grants by the United States and different States for 1910-11 amounting to \$22,963,145. This was an increase of \$4,226,006 over the preceding year. Fifty institutions reported gifts of \$100,000 or over. Columbia reported \$2,535,064, Harvard \$1,745,438, University of Chicago \$1,358,951, New York University \$928,445, and Yale, \$1,134,385. Thus these five institutions received one-third of the entire amount. The most important new legislative appropriations were the

voting of \$600,000 and an annual grant of \$50,000 by the legislature of Maryland to establish and maintain a school of technology in connection with the Johns Hopkins University, and an appropriation by the Massachusetts legislature of \$50,000 annually for five years to the Worcester Polytechnic Institute.

NEW PRESIDENTS. Among the institutions which elected new presidents during 1912 were, Amherst College which elected Dr. Alexander Meiklejohn, professor of philosophy and dean of the faculty of Brown University; the University of Oklahoma which elected Stratton D. Brooks, former superintendent of the Boston public schools; the University of Maine which elected E. T. Fairchild, former State superintendent of public instruction for Kansas, and president of the National Educational Association; and the University of Wyoming which elected Dr. C. A. Dunaway, former president of the University of Montana. Dr. Ira Remsen tendered his resignation as president of Johns Hopkins University. He will remain professor of chemistry which he has been since the opening of the university in 1876.

NEW BUILDINGS. The building activities of the various institutions have been extensive. The most important building completed during the year is the William Rainey Harper Memorial Library at the University of Chicago. The cost of this building was \$800,000. A new library building at the Ohio State University costing \$200,000 has been practically completed. The University of Pennsylvania and Princeton University have each begun work on new graduate schools. In each case the buildings involve an expenditure of about \$500,000. Columbia has under construction a building for the school of journalism. The corner stone of the new Germanic Museum at Harvard, for which Mr. Adolphus Busch contributed \$250,000, was laid June 9, 1912. The University of Illinois is constructing a school of commerce building. Regent Hill's bequest of \$200,000 to the University of Michigan has made possible the building of a new auditorium which will have a seating capacity of 5500. The following are some of the more important building undertakings of the various institutions: University of California, a new agricultural hall costing \$200,000; Harvard University, the new T. Jefferson Coolidge, Jr., memorial laboratory; Cornell University, five agricultural buildings and three veterinary buildings; University of Missouri a building for the department of physics costing \$100,000, and another for the department of chemistry at a cost of \$60,000; University of Iowa, a new physics building costing \$225,000; Sheffield Scientific School, a building costing about \$115,000; University of Illinois, a transportation building, mining building, ceramics building, locomotive-testing laboratory, and several buildings for the school of agriculture. The leading institutions which have built or planned dormitories during the year are Cornell, Columbia, Ohio State University, Yale, Illinois, and Pennsylvania.

CARNEGIE FOUNDATION. The sixth annual report of the Carnegie Foundation for the Advancement of Teaching, covering the year ending September 30, 1911, shows that the endowment of the foundation was \$12,123,000, its income for the year \$590,000, and \$526,000 was expended for retiring allowances and pensions. The number of allowances and pensions in force

PROMINENT EDUCATORS INSTALLED IN 1912

was 373. The average annual payment was \$1631. Fifteen recipients of allowances died and 31 retiring allowances and 17 widows' pensions were granted during the year. Seventy-two universities, colleges, and schools of technology are on the accepted list, the University of Virginia being the only one added during the year. President Pritchett urged upon the colleges themselves a sense of obligation to their old and disabled professors at least equal to that shown by business corporations. The foundation conducted an exchange of teachers which sent 9 American teachers to Prussia and brought 9 Prussian teachers here during the year. The report states that the increase in number and size of post-graduate schools has been greater than the natural need.

In June, 1912, the foundation published a bulletin "Concerning Medical Education in Europe," by Dr. Abraham Flexner. President Pritchett says, "Three-fourths of the medical schools in America would be driven out of existence if the lowest terms upon which medical schools can exist abroad were applied in this country." In spite of serious defects, which are frankly pointed out, the author finds medical education in Germany still leading the world, both because the medical sciences are highly developed in the laboratories and institutes of German universities, and because clinical teachers in the German university are university professors.

NEW INSTITUTIONS AND DEPARTMENTS. The most important new institution to be opened during the year is Rice Institute at Houston, Tex. The endowment of this institution, amounting to about \$10,000,000, is the gift of the late William Marsh Rice. The formal dedication of the institute took place in October, 1912. Dr. Edgar Odell Lovett of Princeton is the first president. It is the aim of this institute to occupy a position in the South similar to that occupied by the Massachusetts Institute of Technology in the North. The New York legislature, in 1911, established a State college of forestry in connection with Syracuse University. Professor H. T. Baker of Pennsylvania State College has been chosen as the dean and director of the college. The college proposes to offer extension work in forestry to the high schools of the State. In September, 1913, there will be offered a four-year course for the training of city foresters. Dr. Talcott Williams, associate editor of the *Philadelphia Press*, was appointed director of the Pulitzer School of Journalism at Columbia University. About 100 students were admitted to the school in September. Men of experience and ability are admitted without examination, and after two years of work are eligible to the degree offered after completion of the course. The four-years course is divided between studies in history, law, government, party organization, economics, unions, trusts, literature, training in reporting, and training in writing. About one-third of the time is devoted to training in writing. Students are expected to do about as much writing each week as the average man in the newspaper office. As nearly as possible, newspaper conditions are introduced in the school in order to train the newspaper men.

AIMS AND METHODS. Recently President Butler has called attention to the wasteful duplication of work in universities and colleges. He believes that the time has come when the large

institutions should concentrate on the work they are best able to do. While the movement toward specialization is not well defined, it is becoming more pronounced each year. One of the most important steps in this direction was the action taken by Amherst College in 1911. Briefly stated, the "Amherst idea" is a return to the cultural subjects in distinction to the technological courses that are offered in the universities. This involves an increased emphasis on the classical studies. Four years of Latin will be required of all for entrance and two years of an ancient language and two years of science are now required in the college course instead of one year each in classics and science as in the past. "Amherst does not look on any man as educated unless he has been taught to interpret the problems of his own day through the lessons of the past and has received a knowledge of classic literature, philosophy, and civilization, gaining discipline in the expression of his own tongue through the mental process of translation. Neither does Amherst look on any man to-day as fully trained for modern life who has not learned the methods of the laboratory and laid a secure foundation in science." The degree of bachelor of science will not be offered to classes entering after 1913, but only the one degree of bachelor of arts. It should be noted that this change seems to have been called forth by an address to the trustees by the class of 1885.

In October, 1912, the board of trustees of Hamilton College determined to keep that college on a strictly classical basis. Unlike the conditions at Amherst, this change seems to be due, not to the judgment of the alumni, but rather against it. Earlier the trustees had voted "that a special commission should consider the curriculum and entrance requirements and report their findings." The commission had for its chairman G. P. Bristol, professor of Latin at Cornell University, and included E. L. Stevens of the New York City board of superintendents, and Calvin N. Kendall, commissioner of education in New Jersey, all Hamilton men. The commission, after a year of work which included much testimony and counter-testimony, recommended, among other things, that the degree of A. B. should be given at Hamilton without Greek, and that not even Latin should be required as an entrance to the non-Greek course. The recommendations of this committee in so far as they concerned Latin and Greek were rejected by the board of trustees. Four years of Latin and three years of Greek are to be required for admission to the classical course and four years of Latin and two years of a modern language for admission to the Latin-Scientific course. The degree of bachelor of arts will be conferred only upon those who have done all the required work of the classical course in both Latin and Greek. These changes become operative with the entering class in 1913, except that provisions will be made for those who began their preparation to meet the older requirements of admission and are now unable to offer all the required subjects. The effect of this change will be watched with interest. The trustees of Amherst, while asserting their belief in the value of Greek, regretted that the requirement of Greek could not be made, since so few preparatory schools teach it. The faculty of the College of Arts and Sciences in the University of Maine have abolished the

requirement of ten hours in the classical department for the bachelor of arts degree, and hereafter neither Latin nor Greek will be required for admission or for the degree.

In some respects the most radical changes from conventional college methods and aims are to be found in Reed College, Portland. President Foster frankly purposes to take full advantage of the freedom from traditions and customs which is to be found in the new institution. Many of the methods he has introduced would be strongly opposed if they were to be tried in older institutions. The institution is to conduct only college work in the liberal arts and sciences until such a time as increased endowment will permit of more advanced work. Particular emphasis is placed upon the teaching ability of the instructors. The requirements for admission to the college are scholarship, health, and character. As regards the first, candidates for admission must have completed a four years high school course of standard grade or its equivalent. This means fifteen units of work. There is no minimum age for entrance, no prescriptions whatever are to be offered concerning the subjects for admission. No students are admitted on condition, nor are there to be any special students. There are no fraternities, no sororities, no inter-collegiate athletics, and few of those outside activities that have often interfered with the supreme objects of higher education. The college purposes to select its students. The fact that of the 263 candidates who applied for admission to the first class, all but 50 were declined, shows how rigidly the college is enforcing its methods.

The faculty of arts and sciences of Harvard has recommended to the governing boards of the university a further limitation of the elective system which is now in operation in that institution. If this recommendation is accepted, a student may continue to take his courses in the parts of the subject which most interest him, but he will be compelled to supplement them by enough other study to see how the parts which he has mastered are related to each other. He will also have to keep in mind what he learns in the early part of the course in order to employ it in his senior year. There would be a continuous pressure on the student to do some independent comparing of facts. The resolution adopted by the faculty is as follows: "That the division of history, government, and economics be authorized to require of all students whose field of concentration lies in this division, in addition to the present requirements stated in terms of courses for the bachelor's degree, a special final examination upon each student's field of concentration, and that the passing of this examination shall be necessary in order to fulfill the requirements for concentration in this division."

Columbia College has under consideration what is termed a "conference programme" for students of the junior and senior years. "Two years' residence will be necessary for a degree, there being no provision for advanced standing. The course of study is to be arranged not on departmental lines, but the aim will be to represent among the teachers the principal divisions of knowledge. A certain number of professors have already offered to conduct, in addition to their present programmes, one three-hour course continued through two years. None of these courses are to be elementary, the students be-

ing expected to familiarize themselves, by private study, with the elementary parts of the subject not already covered by their previous collegiate work. Each student is to appear at least twice a year before a conference of all the instructors and students of the group and to present, by means of an essay or otherwise, evidence of the progress of his studies. This conference which, in plan, is not unlike the disputations of the medieval universities, is to be held weekly. It is designed to be the educational centre of the programme, it being the expectation that participation in and preparation for the conferences will take up a considerable part of the students' time and energies. Each student is to present to the faculty, not later than April 15 of the year of his graduation, an essay on a topic proposed by himself and approved by the committee in charge at least one year before graduation. The essay must show mastery of the topic with which it deals.

The trustees of Rutgers College have adopted a recommendation of the faculty committee on graduate degrees by which the master's degree in that college is to be regarded as a degree to be given after extended liberal study. To this end the subjects studied by the candidate constitute a distinct course consisting of three subjects, not differing essentially from senior elective courses, to be pursued for two years. The committee urged that there were an increasing number of men and women graduating from colleges who were not fitted and did not desire to do the research work for a doctor's degree, but who did desire to pursue further some college subjects. The smaller colleges which are unable to offer proper facilities to candidates for the doctorate may be able to offer abundant opportunities for a continuation of liberal studies.

CHANGE IN ORGANIZATION. The University of Chicago has set aside a fund of about two million dollars to be used in paying retiring allowances to professors or their widows. The statute provides that any person in the service of the university sixty-five years of age and who has been in the service of the university for at least fifteen years in a rank not lower than assistant professor, may retire or be retired with an annual allowance computed as follows:

"(a) For fifteen years' service, 40 per cent. of the average annual salary received during the five years immediately preceding the time of retirement. (b) For each year of service beyond fifteen years, 2 per cent. of the said average annual salary. But no annual allowance shall exceed 60 per cent. of the said average annual salary, nor shall it exceed \$3000." The widow of any person in receipt of or eligible to a retiring allowance will receive one-half the amount of this allowance during her widowhood.

ANNIVERSARIES. Among the anniversaries that received particular attention during the year were: the seventy-fifth anniversary of the founding of Mt. Holyoke College, the seventy-fifth anniversary of the founding of the University of Michigan, the centennial celebration of the founding of Hamilton College, and the one hundred and twenty-fifth anniversary of the founding of the University of Pittsburgh.

EXCHANGE AND VISITING PROFESSORS. The exchange professors from abroad are: Kaiser Wilhelm Professor at Columbia, Dr. Felix Krue-

ger of the University of Halle; visiting professor at Harvard, Dr. Rudolph Eucken, of the University of Jena; visiting French professor at Columbia, Dr. Henri Bergson of the University of Paris; Hyde lecturer at Harvard, Dr. Émile Legouis of the Sorbonne; and the first Japanese exchange professor at Harvard, Dr. Inazo Nitobe, president of the First National College of Tokyo. The Harvard exchange professor at the University of Berlin is Dr. Charles S. Minot of Harvard, and the Theodore Roosevelt Professor at the University of Berlin is Dr. William M. Sloane of Columbia University. Dr. Paul Shorey of the University of Chicago has been appointed Roosevelt Professor for 1913. Among the representatives of foreign universities who have lectured in this country during the year are: Prof. Israel Abrams of Cambridge University, Prof. Émile Borel of the University of Paris, Prof. Guenther Jacoby of the University of Greifswald, Prof. Giovanni Luzzi of the Waldensian School in Florence, Italy, Prof. Wilhelm Paszowski of the University of Berlin, Sir William Ramsay of the University of London, Prof. Ludwig Sinzheimer of the University of Munich, and Prof. Hugo de Vries of the University of Paris.

THE KAHN FOUNDATION. A recent benefaction by M. Albert Kahn of Paris makes it possible for college and university professors to travel freely for a year in order to see the world and in this way broaden their intellectual horizon and widen their sympathies. Two traveling fellows are appointed each year. The fellowship amounts to \$3000 each with an additional \$300 for the purchase of souvenirs, books, etc. No stipulation is made regarding the routes, countries visited, or subjects to be studied. The foundation is administered by E. D. Adams, N. M. Butler, and H. F. Osborn, of New York City; Charles W. Eliot of Cambridge, Mass.; Charles D. Walcott of Washington, D. C.; and Frank D. Franckenthal, secretary of Columbia University, as secretary of the board. The fellows for this year are, Dr. William E. Kellicott, professor of biology in Goucher College, and Ivan M. Linforth, professor of Greek in the University of California.

ATTENDANCE IN FOREIGN UNIVERSITIES. The following table shows the number of students in all foreign universities which report more than five hundred. Unless otherwise indicated the figures are taken from *Minerva Jahrbuch der Gelehrten Welt* for the years specified.

Universities	1900-01	Attendance 1901-02	1910-11	1911-12

* Estimate of attendance based on last available report. (a) The figures for England and Wales are taken from the "Report of the Commissioner of Education," 1911, p. 554. (b) The figures for France are taken from the "Report of the Commissioner of Education," 1911, p. 565. (c) The figures for Germany are taken from "Deutscher Universitäts Kalender" for the years named. (d) For the year 1897-98. (e) For the year 1899-1900. (f) For the year 1902-03. (g) For the year 1909-1910. (r) Taken from the report of the institution concerned.

BIBLIOGRAPHY. Among the books dealing with higher education published in 1912 are: *Professional Distribution of College and University Graduates*, by Bailey Burritt; *Medical Education in Europe*, by Abram Flexner; *The Essentials of Liberal Education*, by President John G. Hibben; *The Rhodes Scholarships*, by George R. Parkin; and *Why Go to College*, by Clayton C. Sedgwick.

UPPER SENEGAL AND NIGER. A French West African colony. Bamako, the capital, has 6539 inhabitants; Bobo-Dioulasso, 7788; Ségou, 6255; Kayes, 5932; Djenné, 4904. About a million and a half of the population are Mussulmans; the remainder are fetichists and polygamists of a low type. The railway from Kayes to Kowlikoro (553 kilometers) reaches the Niger at Bamako. A branch (12 kms.) joins Médine to Kayes; another (44 kms.) connects Kayes with Ambidédi. Cotton is grown, as well as rice, corn, millet, peanuts, sesame, manioc, tobacco, etc. Rubber and gums

are gathered, and the forests abound in valuable timbers. Horses, donkeys, cattle, dromedaries, and ostriches are raised in great numbers. Gold is mined. A lieutenant-governor (in 1912, M. Clozel) administers the colony and controls the government of the military territory of the Niger, being himself under the direction of the governor-general for French West Africa. See FRENCH WEST AFRICA.

URANIUM. See PHYSICS.

URIC ACID. See ATOPHAN.

URUGUAY. See AGRICULTURE.

URUGUAY. A South American republic on the Atlantic coast between Brazil and Argentina. The capital is Montevideo.

AREA AND POPULATION. The area of Uruguay is stated at 186,925 square kilometers (72,172 square miles), and the population at the census of October 12, 1908, was 1,042,686. The department of Montevideo, with 664 square kilometers (256 square miles), had 309,231 inhabitants. Of the total, 50.88 per cent. were males; 82.62 per cent. Uruguayans; 17.38 per cent. foreigners. Of the foreigners, Italians numbered 62,357, Spaniards 54,855, Brazilians 27,789, and Argentines 18,600. The population of the cities and chief towns was: Montevideo, 291,465; Paysandú, 20,953; Salto, 19,788; Mercedes, 15,667; Minas, 13,345; Melo, 12,355; San José, 12,297; Rocha, 12,200; Florida, 10,606; Durazno, 10,597. Population of the republic calculated for December 31, 1911, 1,177,560 (Montevideo department, 338,175). Recently estimated population of Montevideo city, 308,710. In 1910 and 1911 respectively, marriages, 6818 and 6967; births, 35,927 and 37,530; deaths, 16,515 and 16,552; vegetative increase, 19,412 and 20,978. Immigrants and emigrants in 1910, 119,684 and 105,683; in 1911, 141,224 and 123,934. In 1912 a law was enacted for the encouragement of immigration, particularly that of a good class of farm laborers.

INDUSTRIES AND COMMERCE. The principal industry is grazing. The 1908 livestock census returned 8,192,602 cattle, 26,286,296 sheep, 556,307 horses, 17,671 mules, 4428 asses, 180,099 swine, and 19,951 goats. Only a small part of the country is under cultivation. The principal crop is wheat; others of some importance are linseed, corn, oats, barley, tobacco, olives, and grapes. Mining and manufacturing are little developed.

The special trade has been valued as follows, in thousands of gold pesos:

	1907	1908	1909	1910	1911
Imports 37,471	38,730	37,157	40,814	47,412
Exports 34,912	40,296	46,150	40,801	46,051

Comparative figures for trade details for 1910 and 1911 are not available, but for the first six months of these two years the following export values by classes are reported: Grazing and meat industry, 27,341,316 and 25,531,595 pesos; agriculture, 700,556 and 601,006; miscellaneous industries, 969,724 and 1,036,287; ships' supplies, 155,621 and 56,179; other, 44,605, 57,986; total, 29,211,822 and 27,283,053. For the six months of 1911, the exports of animals and their products included: Live animals, 451,257 pesos; meats and extracts, 4,474,534; hides and skins, 4,684,594; grease and tallow, 610,965; wool, 15,010,897; the agriculture exports included oil seeds valued at 306,795

pesos and flour 186,280. Imports from and exports to the principal countries in 1910, in thousands of pesos: United Kingdom, 12,128 and 2772; Germany, 6841 and 6900; United States, 4344 and 3890; France, 3842 and 8889; Italy, 2943 and 1586; Belgium, 2811 and 4156; Argentina, 2772 and 8474. In 1910 there entered 5240 vessels, of 9,333,144 tons, and cleared 5206, of 9,230,930 tons. Merchant marine (1911): 30 steamers, of 23,960 tons net, and 62 sail, of 27,178 tons net.

COMMUNICATIONS. The reported length of railways in operation at the end of 1911 was 2512 kilometers (1561 miles); under construction, 610 kilometers (379 miles). It was announced towards the close of 1912 that a branch of the Central Uruguay Railway from Rivera to Santa Ana, where it connects with the Rio Grande do Sul railways of Brazil, would soon be opened to traffic. Other construction was in progress during the year, including the Pietra Sala-Tres Arboles line, 38 miles in length. Among several projected lines is one from Montevideo to Artigas, on the northern frontier.

Reported telegraph lines (1910), 7804 kilometers (4849 miles), with 319 offices. Post offices (1911), 1031.

FINANCE. The standard of value is gold, and the monetary unit the peso, par value \$1.03424. Estimated revenue and expenditure for the fiscal year 1910, 21,079,880 and 21,075,330 pesos; for 1911, 35,142,360 and 35,133,812. About one-half the revenue is derived from customs. Larger items of estimated expenditure for the fiscal year 1911: National obligations, 17,110,911 pesos; war and marine, 4,710,491; interior, 3,351,754; industry, 3,219,641; finance, 2,157,732; public instruction, 1,487,765; public works, 1,385,340. Public debt December 31, 1911: External consolidated, 122,561,041 pesos; international, 2,387,000; internal, 6,909,500; total, 131,857,541. Debt charges in 1910, 7,573,447 pesos.

ARMY. A small standing or active army was maintained and a national guard. The recruitment of the army is mainly voluntary and involves two to five years' service with reengagements up to the age of forty-four. The government believed that an efficient standing army was a guarantee of internal peace and accordingly \$5,000,000 of the budget for 1912-1913 was allotted to the ministry of war and marine. The active army was made up of 4 battalions of rifles, 9 cavalry regiments, 2 field batteries, and fortress artillery, with a peace strength of about 4000. In time of war it was estimated that a field army with three divisions amounting to about 12,000 men could be organized. There was also a police force of about 5000.

NAVY. Vessels in commission in 1912 included the following: One armored cruiser, of 2200 tons (*Montevideo*, built in 1887); one torpedo cruiser, of 1500 tons (*Uruguay*, 1910); one gunboat, of 300 tons (*18 de Julio*); one schoolship, of 300 tons (*Sudrez*); three dispatch boats. The personnel comprises about 60 officers and 600 men.

GOVERNMENT. The president is elected by the General Assembly for four years and is not eligible for a consecutive term. He is assisted by a responsible ministry of seven members. The General Assembly consists of the Senate (19 members, elected for six years indirectly) and the House of Representatives (90 members, elected for three years by direct vote). The president in 1912 was José Batlle y Ordóñez.

He was president in 1903-7 and on March 1, 1911, again assumed the executive office, succeeding Claudio Williman.

Authentic current statistics of Uruguay have been difficult and often impossible to obtain. In 1912 the Statistical Office was reorganized, and it is hoped that hereafter more consistent and accurate reports will be made public.

UTAH. POPULATION. According to the Census Bureau statistics compiled during 1912, out of a total population of 373,351 in 1910, 63,408 were foreign-born whites, compared with 52,804 in 1900. Of these, 18,082 came from England; 7227 from Sweden; 8295 from Denmark; 3117 from Italy; 2850 from Scotland; 2304 from Norway; 3956 from Germany, and 3991 from Greece. Other European countries were represented by smaller numbers. The negroes in the State in 1910 numbered 1144 and the mulattoes 290. In 1890 the negroes numbered 588 and the mulattoes 209.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1912 are shown below:

		Acreage	Prod. Bu.	Value
Corn1912	9,000	270,000	\$202,000
1911	8,000	280,000	227,000
Wheat1912	236,000	6,069,000	4,544,000
1911	225,000	5,025,000	3,518,000
Oats1912	91,000	4,222,000	2,069,000
1911	87,000	3,889,000	1,828,000
Rye1912	6,000	90,000	61,000
1911	5,000	78,000	55,000
Potatoes1912	19,000	3,515,000	1,722,000
1911	15,000	2,100,000	1,785,000
Hay1912	368,000	21,023,000	8,184,000
1911	380,000	2950,000	8,550,000

a Tons.

MINERAL PRODUCTION. The gold production of the State in 1911 was \$4,696,998, compared with \$4,032,085 in 1910. The increase was due to the larger output of copper ores in Salt Lake County and of siliceous ores in Juab County. The silver output in 1911 was 12,473,787 fine ounces, compared with 10,466,971 fine ounces in 1910. The larger part of the production was from the lead-silver ore produced in Juab, Salt Lake, Summit, Utah, and Wasatch counties.

The production of copper in 1911 was 142,340,215 pounds, compared with 125,185,455 pounds in 1910. The marked increase was due to the production from the Bingham district. The total recorded output of the State at the close of 1911 was 797,044,788 pounds. In its total output the State ranks fourth among the copper-producing States. Two copper-mining plants were operated during 1911.

The production of coal in the State in 1911 was 2,513,175 short tons. This production was about the same as in 1910, the difference being less than 5000 tons. The value of the output, however, showed an increase of \$24,110. That the decrease was not larger was due to developments in Emery County, which nearly trebled its production of 1910. There were employed in the coal mines of the State in 1911 3060 men.

MANUFACTURES. The Thirteenth Census included statistics of manufactures in the State. These are for the calendar year 1909, and the most important general results are shown in the following table, together with the percentages of increase from 1904 to 1909:

	Number or Amount	P. C. of Inc.
	1909	1904 1904-09
Number of establishments	749	606 23.6
Persons engaged in manufactures ...	14,123	9,650 46.5
Proprietors and firm members	688	619 11.1
Salaried employees	1,660	979 69.6
Wage earners (average number)	11,785	8,052 46.4
Primary horsepower	42,947	19,397 121.4
Capital	\$52,627,000	\$26,004,000 102.4
Expenses	54,207,000	32,601,000 66.3
Services	10,366,000	6,195,000 67.3
Salaries	1,966,000	1,038,000 89.4
Wages	8,400,000	5,157,000 62.9
Materials	41,268,000	24,940,000 65.5
Miscellaneous	2,575,000	1,466,000 75.6
Value of products	61,989,000	38,926,000 59.2
Value added by manufacture (value of products less cost of materials)	20,723,000	13,986,000 48.2

The industry in which the largest number of wage earners was employed was that connected with cars and general shop construction and repairs by steam railroad companies, 1731. In printing and publishing were 967; in manufacture of confectionery, 586; in canning and preserving, 396; in lumber and timber products, 431. The most important industries in point of value of product were flour-mill and gristmill products, \$3,131,000; in car construction the product was valued at \$2,740,000; in printing and publishing, \$2,405,000; in the manufacture of butter, cheese, and condensed milk, \$1,971,000; in the manufacture of confectionery, \$1,952,000. Other important industries were slaughtering and meat-packing, and the brewing of malt liquors. The total number of wage earners was 11,785, of whom 1223 were females. The wage earners under 16 years of age numbered 110, of whom 18 were women. The prevailing hours of labor for about one-half the wage earners employed ranged from 54 to 60 a week, although 25.2 per cent. of the total number were employed in establishments where less than 54 hours a week prevailed, and 17.1 per cent. in establishments where more than 60 hours a week prevailed. The largest number of wage earners was found in Salt Lake City, 4287; in Ogden were 1323. These were the only two important manufacturing centres in the State.

CHARITIES AND CORRECTIONS. There is no department having direct charge of the charitable and correctional institutions of the State. Previous to 1912 the only organized charitable society was one in Salt Lake City, which was supported by private subscriptions, and the work supervised by a secretary. The ladies of the Mormon Church have women's relief societies in practically every ward and precinct in the State, under one general head, with headquarters in Salt Lake City. The association was newly organized in 1912 to replace the old Salt Lake Charitable Society. The primary object of this organization is to afford immediate relief pending investigation, and to avoid any oversight or duplication of charitable work. In a number of counties throughout the State infirmaries and poor farms are maintained by public funds, and in all counties relief and aid are given to indigents from a fund raised by annual levy of one mill taxed against all assessable property. The State maintains a State Mental Hospital at Provo, which averages about

400 inmates; a State Industrial School at Ogden, with an average of about 100 to 125 inmates; and a School for the Deaf and Blind at Ogden, with an enrollment of from 100 to 125. The State has a juvenile court which has done excellent service in the last few years.

POLITICS AND GOVERNMENT

The legislature did not meet in 1912, as the sessions are biennial and the last was held in 1911. The next session convenes January 13, 1913. State officers were elected November 5.

Utah was one of the two States carried by President Taft in the presidential election. The Progressive movement has made little or no headway in the State and the Republican machine, headed by Senators Smoot and Sutherland, has retained full control. The delegates to the Republican national convention were pledged to President Taft, while the Democratic delegates were uninstructed. The Republicans renominated William Spry for governor. The Progressives nominated N. L. Morris, and the Democrats John Franklin Tolton. The election on November 5 resulted as follows: For President, Taft received 42,013 votes; Wilson, 36,579; Roosevelt, 24,174; Debs, 8989; and Reimer, Socialist Labor, 509. President Taft's plurality was 5434. For governor, Spry (Rep.) received 42,552 votes; Tolton (Dem.), 36,076; Morris (Prog.), 23,591; Burt (Soc.), 8797; and Battell (Soc. Labor), 479. The vote for representatives in Congress was: Joseph Howell (Rep.), 43,133; Jacob H. Johnson (Rep.), 42,049; T. D. Johnson (Dem.), 36,640; Mathonihah Thomas (Dem.), 37,192; Stephen Love (Prog.), 22,358; Lewis Larson (Prog.), 21,931; William M. Knerr (Soc.), 8953; Murray E. King (Soc.), 8971; Elias Anderson (Soc. Labor), 555; Harry S. Joseph (independent), 187.

The legislature is Republican by a majority of 29 on joint ballot.

STATE GOVERNMENT. Governor, William Spry; Secretary of State, D. Mattson; Treasurer, J. D. Jewkes; Auditor, L. G. Kelly; Attorney-General, A. R. Barnes; Superintendent of Education, A. C. Nelson; Commissioner of Insurance, Willard Done—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, W. M. McCarty; Justices, J. E. Frick and Daniel N. Straup; Clerk, H. W. Griffith—all Republicans.

STATE LEGISLATURE, 1913. Democrats: Senate, 2; House, 14; joint ballot, 16. Republicans: Senate, 16; House, 31; joint ballot, 47. Republican majority: Senate, 14; House, 17; joint ballot, 31.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

VACCINATION. See SMALL-POX AND VACCINATION.

VACUUM PUMP. See PHYSICS.

VANDERBILT UNIVERSITY. An institution for higher education at Nashville, Tenn., founded in 1872. The students enrolled in the various departments of the university in the collegiate year 1911-12 were 1120. The faculty numbered 123. Professor Edward Mims, formerly of the University of North Carolina, was appointed to fill the chair of English. There were no noteworthy benefactions during the year. The productive funds of the university amount to about \$1,750,000 and the in-

come to about \$200,000. The library contained about 50,000 volumes. Chancellor, J. H. Kirkland, LL. D., D. C. L.

VANIMAN, MELVIN. See AERONAUTICS.

VARIATION OF LATITUDE. See ASTRONOMY.

VASSAR COLLEGE. An institution for the higher education of women at Poughkeepsie, N. Y., founded in 1861. The total enrollment for the degree of A. B. in the autumn of 1912 was 1042. The limit for admission to the college is about 1000. The faculty numbered 110. There were no noteworthy changes in the faculty during the year. Among the important benefactions were gifts of \$28,000 from the alumnae, and \$75,000 additional from Mrs. Russell Sage for a new residence hall. The productive funds of the college amount to \$1,472,514. There are 76,123 volumes in the library. President, James M. Taylor, D. D., LL. D.

VEILLER, BAYARD. See DRAMA.

VEINS, TRANSPLANTATION OF. See CARREL, ALEXIS.

VENEZUELA, UNITED STATES OF. A republic lying east of Colombia on the northern coast of South America. Capital, Caracas.

AREA AND POPULATION. Under the constitution of August 5, 1909, Venezuela is organized into twenty states, two territories, and a federal district. The area, as officially stated, is 1,020,400 square kilometers (393,976 square miles); according to an unofficial planimetric calculation, 942,300 sq. kilometers (363,822 sq. miles). The area cannot be definitely fixed until the settlement of the boundary dispute with Colombia. No census has been taken since 1891, when a population of 2,323,527 was returned, 2.27 per square kilometer. On the basis of this census and the political division of 1909, the Federal District had a density per square kilometer of 58.65; Carabobo state, 36.42; Nueva Esparta, 31.65; Trujillo, 19.80; Miranda, 17.79; Aragua, 16.96; Yaracuy, 12.09; Lara, 9.58; Táchira, 9.16; Sucre, 7.80. The territory of Amazonas, with an area of 281,700 square kilometers, had an average of only 0.16. The total population as calculated for 1908 was 2,647,624, and for 1911 2,743,841. It is estimated that about 70 per cent. of the people are mestizos, about 10 per cent. whites, and the remainder negroes and tribal Indians. Movement of population in 1910 and 1911: Marriages, 8120 and 8017; births, 82,487 and 83,758; deaths, 55,436 and 54,428; arrivals, 8420 and 9204; departures, 7374 and 7219. Principal towns, with estimated population: Caracas (in Federal District), 73,000; Maracaibo (Zulia), 50,000; Valencia (Carabobo), 40,000; Barquisimeto (Lara), 32,000; Puerto Cabello (Carabobo), 14,000; La Guaira (Federal District), 12,000.

EDUCATION. It is probable that at least 60 per cent. of the inhabitants are entirely illiterate. Pupils receiving elementary education in the last quarter of 1909 numbered 48,148; of these, 31,850 were in the national schools (1004), 4723 in the federal schools (146), 7564 in the municipal schools (225), and 4011 in private schools (150). In 1911 a reorganization of the elementary school system was undertaken. For secondary and higher instruction there are reported 34 national and 63 private colleges. There are two universities, at Car-

acas and Mérida, and a few institutions for special or technical instruction.

PRODUCTION AND COMMERCE. The crops include coffee, sugar cane, cacao, and cereals. Among the forest products are rubber, balata, copaiba, and vanilla. Stock-raising is important, and the number of cattle probably exceeds 2,000,000. Mining is not highly developed; the unsettled political conditions to which the country has been subject have repelled foreign investments in mining and transportation enterprises. Large mineral resources exist, however, including gold, silver, copper, iron, asphalt, and petroleum.

Total imports and exports have been valued, in bolivars, as follows, for years ended June 30:

	1909	1910	1911	1912
Imp.	49,180,485	56,640,971	80,178,933	105,677,096
Exp.	83,145,316	86,419,582	96,920,228	133,323,961

Exclusive of specie, the imports of 1911-12 were valued at 89,773,572 bolivars and the exports at 131,347,134; the specie imports included over 7,780,000 bolivars for coinages executed in France. The leading import is cotton goods. Leading exports, in the fiscal years 1911 and 1912, in thousands of bolivars:

	1911	1912	1911	1912
Coffee	43,111	79,314	Algrettes	1,636
Cacao	18,605	15,937	Goat skins	2,367
Balata and rubber	14,461	11,631	Asphalt	1,587
Hides	4,520	10,271	Horned animals	942
Gold	2,914	5,353		1,152

Trade by countries in the fiscal years 1910 and 1912, in thousands of bolivars:

	Imports		Exports	
	1910	1912	1910	1912
United States	18,451	32,309	30,976	43,887
United Kingdom	15,242	27,167	9,682	10,696
Germany	10,661	16,314	8,306	22,590
France	3,760	13,895	28,680	39,397
Netherlands	3,911	7,641	4,283	4,858
Spain	2,757	4,403	3,240	8,068
Italy	1,489	3,397	169	1,275
Cuba	14	14	619	634
Other	356	717	464	2,419
Total	56,641	105,677	86,420	133,324

Vessels entered at the ports in the year 1911-12, 1950, of 1,570,399 tons; Merchant marine (1911), 8 steamers, of 2046 tons net, and 15 sail, of 2432 tons net.

COMMUNICATIONS. Railways extend from the coast into the interior; but as they are not connected to form a system, they afford only inadequate transportation facilities. Lines in operation in 1911 aggregated 925 kilometers (575 miles). The gross receipts for that year are reported at 10,790,199 bolivars, and gross expenditures at 6,219,525 bolivars. A contract was let for a 3 ft. 2 in. gauge line from Caracas eastward through Guareras to Quatire. There is a large amount of internal navigable waterway. Reported length of telegraph lines in 1911, 7598 kilometers, with 181 offices; post offices, 284.

FINANCE. The monetary unit is the bolivar, with a par value of 19.295 cents. Revenue and expenditure in the year ended June 30, 1909, 50,410,133 and 47,668,810 bolivars; in 1910, 48,-

552,857 and 52,337,125. The budget for the fiscal year 1912-13 balanced at 52,500,000 bolívares, the estimated expenditure including 5,066,666 extraordinary. Estimated receipts: Customs, 22,000,000 bolívares; surtax, 12,292,500; stamps and revenue from salt and spirits, 13,200,000; other, 5,007,500; total, 52,500,000. Estimated ordinary expenditures: Finance and public debt, 15,372,804 bolívares; interior, 11,440,815; war and marine, 9,500,000; public works, 3,605,763; public instruction, 3,250,832; fomento, 3,210,720; foreign affairs, 1,052,400; total, 47,433,334. Public debt December 31, 1911: Foreign, 123,204,254 bolívares; internal, 62,587,001; credit of the mixed commissions, 3,507,283; total, 189,298,538.

ARMY. The active army was composed of 20 battalions of infantry, each of 400 men, and 8 batteries of artillery, each of 200 men.

NAVY. The navy in 1912 included three gunboats, a torpedo boat, a dispatch boat, a transport, a tug, and the old Spanish warship *Isla de Cuba*. The latter was purchased in 1912 from the United States government.

GOVERNMENT. The present constitution, which bears date of August 5, 1909, vests the executive authority in a president elected for four years. The legislative body is composed of a senate (40 members) and a chamber of deputies. The president in 1912 was Gen. Juan Vicente Gómez, whose term of office began April 19, 1910. Council of government: President, Gen. José Ignacio Pulido; first vice-president, Gen. Alejandro Ibarra; second vice-president, Gen. Mariano García; secretary, Dr. A. Borjas. Council of ministers (formed April 29, 1912): Interior, Cesar Zumeta; foreign affairs, Dr. J. L. Andara; finance, Manuel Porras; war and marine, Gen. Ismael Pereira Álvarez; public works, R. R. Álvarez; public instruction, D. Arreaza Monagas; fomento, Pedro Emilio Coll.

VENICE, CAMPANILE OF. See ARCHITECTURE.

VERMONT. POPULATION. According to the Census Bureau statistics compiled in 1912, out of a total population in 1910 of 355,956 the foreign-born whites numbered 49,861, compared with 44,694 in 1900. Of these the largest number, 14,624, came from French Canada; from other parts of Canada, 11,354; from Ireland, 4936; from Italy, 4591; from Scotland, 2615; and from Russia, 2454. The negroes in the State in 1910 numbered 1621, and the mulattoes 436. In 1890 the negroes numbered 937 and the mulattoes 416.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1912 are given below:

	Acreage	Prod. Bu.	Value
Corn1912	45,000	1,800,000	\$1,296,000
.....1911	46,000	1,886,000	1,509,000
Wheat1912	1,000	25,000	24,000
.....1911	1,000	28,000	28,000
Oats1912	77,000	3,311,000	1,589,000
.....1911	76,000	2,660,000	1,569,000
Potatoes1912	26,000	3,640,000	2,002,000
.....1911	26,000	2,730,000	2,157,000
Hay1912	1,010,000	a1,515,000	21,210,000
.....1911	930,000	a1,209,000	16,926,000
Tobacco1912	100	b170,000	31,000
.....1911	100	b170,000	27,200

a Tons. b Pounds.

MANUFACTURES. The results of the census of manufactures taken in 1910 are shown in

general in the following table, together with the percentage of increase from 1904-1909:

	Number or Amount 1909	Amount 1904	P. C. of Inc. 1904-09
Number of establishments	1,958	1,699	15.2
Persons engaged in manufactures	38,580	37,015	4.2
Proprietors and firm members	2,113	1,856	13.8
Salaried employees	2,679	2,053	30.5
Wage earners (aver. number) ..	33,788	33,106	2.1
Primary horsepower	159,445	140,616	12.4
Capital	\$73,470,000	\$62,659,000	17.3
Expenses	59,851,000	54,677,000	9.5
Services	20,075,000	17,324,000	15.9
Salaries	2,803,000	2,103,000	33.3
Wages	17,272,000	15,221,000	13.5
Materials	34,823,000	32,430,000	7.4
Miscellaneous	4,953,000	4,923,000	0.6
Value of products	68,310,000	63,084,000	8.3
Value added by manufacture (value of products less cost of materials)	33,487,000	30,654,000	9.2

The chief manufacturing industry is marble and stone quarrying. In this, 10,411 wage earners were employed and the value of the product was \$12,395,000. In lumber and timber products were employed 4790 wage earners and the value of the product was \$8,598,000; in the manufacture of butter, cheese, and condensed milk 519 were employed and the product was valued at \$8,112,000; in woolen, worsted, and felt goods manufactures were employed 2294, and the product was valued at \$4,497,000. Flour-mill and grist-mill products gave employment to 156 wage earners, with a product valued at \$4,133,000. Other important manufactures, with the value of their product, were paper and wood pulp, \$3,902,000; foundry and machine shop products, \$3,775,000; hosiery and knit goods, \$1,746,000; furniture and refrigerators, \$1,618,000; patent medicines and compounds, \$1,290,000; men's clothing, \$1,274,000; car construction, \$1,135,000; and printing and publishing, \$1,039,000. The total number of wage earners was 23,783, of whom 4698 were women. The wage earners under 16 years of age numbered 211, of whom 67 were women. The prevailing hours of labor for the great majority of wage earners ranged from 54 to 60 a week, only 17.7 per cent. being employed in establishments where the employees worked less than 54 a week, and 1.9 per cent. in establishments where the employees worked more than 60 hours a week. The largest number of wage earners was in Burlington, 2371; in Barre, 2340; in Rutland, 1636. These are the three largest manufacturing centres in the State.

FINANCE. The receipts for the fiscal year 1912 amounted to \$2,303,754. There was at the beginning of the fiscal year a balance on hand of \$566,141. The total disbursements for the fiscal year were \$2,350,508, leaving a balance on hand at the end of the year of \$519,388. The chief sources of income were taxation of railroads, savings banks and trust companies, telephone and telegraph companies, and insurance companies. The chief expenditures were for education, support of State institutions, and for the State government. The State debt is \$346,631, including \$135,500 in bonds and \$211,131 due the school fund.

POLITICS AND GOVERNMENT

The State legislature met in 1912 and the most important measures enacted will be found in the paragraph *Legislation* below. The election for State officers was held on September 3. See below.

A convention for the election of delegates to the Republican national convention was held on April 10 and the delegates were instructed to vote for President Taft. The delegates to the Democratic national convention were pledged to vote for Governor Wilson. On June 27 the State convention for the nomination of State officers nominated Allan M. Fletcher for governor. The Democrats nominated Harland B. Howe, and the Progressives, Fraser Metzger. State elections in Vermont are held on September 3 and in the presidential year they are of the greatest national interest because they furnish a possible criterion for results in November. The voting revealed the fact that the Republican party had been practically cut in two when no candidate received a majority of the votes. The figures were as follows: Fletcher, Rep., 26,237; Howe, Dem., 20,001; Metzger, Prog., 15,629. Mr. Fletcher had a plurality of 6183 over Howe, Democrat, but he lacked the majority required for election by the Vermont constitution. It was necessary, therefore, to carry the election to the legislature. This body met in joint session and elected Mr. Fletcher governor. This was the first defeat of the Republican party in the State in twenty years. To the aggressive campaign made in the State by Mr. Roosevelt previous to the election was generally attributed the heavy Progressive vote. The result of the election of November 5 was as follows: For President, Taft received 23,305 votes; Roosevelt, 22,070; Wilson, 15,350. Vermont was one of the two States carried by President Taft.

STATE GOVERNMENT. Governor, Allan M. Fletcher; Lieutenant-Governor, F. E. Howe; Secretary of State, Guy W. Bailey; Treasurer, Edward H. Deavitt; Auditor, Horace F. Graham; Attorney-General, R. E. Brown; Adjutant-General, Lee S. Tillotson; Superintendent of Education, Mason S. Stone; Commissioners of Insurance, E. H. Deavitt and Guy W. Bailey; Commissioner of Agriculture, O. L. Martin—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, John W. Rowell; Assistant Justices, Loveland Munson, John H. Watson, Seneca Haselton, George M. Powers; Clerk, L. C. Moody—all Republicans except Haselton.

STATE LEGISLATURE, 1913. Republicans, Senate, 27; House, 164; joint ballot, 191. Democrats, House, 57; joint ballot, 57. Progressives, Senate, 3; House, 22; joint ballot, 25. Republican majority, Senate, 24; House, 85; joint ballot, 109.

The representatives in Congress will be found in the article UNITED STATES, section *Congress*.

VERMONT, UNIVERSITY OF. A STATE institution for higher education in Burlington, Vt., founded in 1791. The students enrolled in the autumn of 1912 numbered approximately 550. There were 102 members of the faculty. Professor Frederick W. Stone assumed directorship of athletic and gymnasium instruction in the university on September 1, 1912. There were no important changes in the faculty during the year. Several noteworthy benefactions were

received during the year. The productive funds of the university amount to about \$1,000,000 and the annual income to about \$200,000. The library contained about 85,000 volumes. President, Guy Potter Benton, D. D.

VERNON, FRÉDÉRIC. A French engraver, died October 28, 1912. He was born in Paris in 1858, and was educated at the Beaux Arts, and the School of Decorative Arts. In 1887 he won the Prix de Rome for engraving. His subject was "Jason and the Golden Fleece." Among his best known works are medals commemorative of the centenary of the "Marseillaise," and of the arrival of the Czar at Cherbourg. He was one of the foremost of French engravers.

VERRALL, ARTHUR WOOLGAR. An English scholar and educator, died June 16 1912. He was born in Brighton, England, in 1851, and was educated at Wellington College and Trinity College, Cambridge, graduating from the latter in 1873. He was made a fellow following his graduation and remained a fellow of Trinity until his death, becoming in course of time a tutor. He studied law and in 1877 was called to the bar. His classical studies, as far as his published work is concerned, lay chiefly with the Greek dramatists. An edition of *Medea* appeared in 1881 and was followed at intervals by editions of *Æschylus* and *Euripides*. His translations are notable as combining human interest with accuracy of scholarship.

VETERINARY MEDICINE, SCHOOLS OF. See UNIVERSITIES AND COLLEGES.

VETERINARY SCIENCE. The year 1912 was notable for a serious outbreak of a disease among horses which became epidemic in Kansas during the third week in August and spread to the neighboring States, resulting in the loss of many millions of dollars. It is estimated that in Kansas alone 30,000 horses died during the period between July 15 and October 1, while Nebraska and Colorado lost heavily. The indirect loss, due particularly to farm work undone on account of the scarcity of horses, is estimated at twice the direct loss. The disease, which presented a variety of symptoms, many of which resembled those of the so-called "blind staggers" and indicated a derangement of the central nervous system, was characterized by its sudden onset, rapid course, epizootic nature, and high rate of mortality. A bacteriological study of brains showing well-defined lesions resulted in the isolation of micro-organisms which bear a remarkable similarity, both morphologically and culturally, to the diplococcus described as being present in the Borna disease of Europe, said to be a serious cerebrospinal meningitis, but no pathogenic properties were shown by inoculations made on experiment animals.

In reviewing the advances made during the year in the field of animal diseases and therapeutics, special mention should be made of the work with infectious abortion in cattle, the application of the complement fixation test as a reliable means for diagnosing additional diseases, including contagious abortion, dourine, Malta fever, and hemorrhagic septicemia, of the application of Ehrlich's "606," which is placed on the market under the trade name of Salvarsan, in treating contagious pleuropneumonia of equines, lymphangitis, canine piroplasmosis, etc., and of the preparation by Ehrlich of a new drug, known as "914," or Neosalvarsan, which is even more toxic to trypanosomes than

is Salvarsan. The translation from the German of Hutyra and Marek's large two-volume quarto work on the pathology and therapeutics of the diseases of domestic animals, edited by Doctors J. R. Mohler and A. Eichhorn, which appeared during the year, has done much for the advancement of the veterinary profession in an educational way.

TUBERCULOSIS. Investigations of the tubercle bacilli in 70 cases of bone and joint tuberculosis in children were reported by Fraser of the research laboratory of the Royal College of Physicians, Edinburgh. The bovine type was present in 41 cases, the human type in 26 cases, and both the bovine and human types in 3 cases. Fraser reports that there can be no doubt that milk was the medium through which the infection occurred. Fresh evidence was obtained to prove that bovo-vaccination, or the injection of living tubercle cultures of an insufficient degree of virulence to cause progressive tuberculosis in cattle, is a practice that should be emphatically condemned as unfit for use in the control and eradication of bovine tuberculosis. The work of eradication of bovine tuberculosis in the District of Columbia commenced in the fall of 1909 and continued in 1912, by the systematic retesting of cattle within the area and the testing of cattle brought into the District from various States for dairy and breeding purposes, has reduced the percentage from 18.87 at the time the work was commenced to 1.29. But 3.61 per cent. of the premises was found to be infected, against 18.35 per cent. in 1909.

INFECTIOUS ABORTION. From the viewpoint of economic importance, infectious abortion ranks second only to tuberculosis, and in certain sections of the country even supersedes the latter in the monetary loss it occasions. The direct loss reaches into the millions, while the potential loss is enormous and practically inestimable. During the year it was shown that the bacillus found by Schroeder and Cotton in 1911 to be of common occurrence in milk from apparently healthy cows is no other than that of infectious abortion, namely *Bacillus abortus*. In investigations conducted by the federal bureau of animal industry the bacillus was found in the tonsils of children, presumably as a result of drinking infected milk. It has been found that cows may continue to expel the abortion bacillus with their milk continuously for several years without giving evidence of their infected condition by aborting or in any other known manner. Studies of ordinary market milk indicate that infectious abortion is a more common disease in dairy herds than it was formerly believed to be, that its frequency is increasing, and that vigorous measures should be taken against its further spread. Whether the abortion bacillus has the power to injure human health still remains unknown.

TICK FEVER AND TICK ERADICATION. The tick eradication work carried on by the federal bureau of animal industry in cooperation with authorities of various southern States resulted in the release from quarantine of 22,827 square miles of territory, distributed among 11 States. The total area released since the work was commenced in 1906 amounts to 162,648 square miles, or an area equal to more than the combined areas of Georgia, Alabama, and Mississippi, and nearly one-fourth of the total area infested at the time of beginning the work.

The outlook is bright for the eventual control of this parasite, the presence of which has been a great handicap to cattle-raising in the South.

HOG CHOLERA. This serious disease of hogs, though the source of great loss, was not so prevalent as in 1911. Experiments seem to prove quite definitely that pigs from immune or hyperimmune sows are themselves immune against hog cholera at birth and that this immunity lasts for at least three weeks. Thirty States are now engaged in distributing anti-hog-cholera serum, a vast majority of which are manufacturing the serum. Investigations made by the bureau of animal industry led to the estimate that considerably more than one million doses of anti-hog-cholera serum were manufactured and applied in all the various States combined. The outlook for the ultimate control and possibly the complete eradication of hog cholera is now brighter than it has been at any time since the disease reached its present state of severity in this country.

TETANUS. In investigations conducted with a view to determining the smallest quantity of antitoxin which will protect a horse against a positive infection of tetanus, it was found that 500 American units is a sufficient dose for use as a prophylactic even in cases where the infection has occurred for days prior to the injection of the antitoxin.

MALTA FEVER. Further investigation of this disease in Texas and New Mexico, where it is also locally known as "mountain fever" and "slow typhoid fever," has shown that it has existed in these States for at least 25 years. Reports indicate that the disease also occurs among goats in Arizona.

FOOT-AND-MOUTH DISEASE. This highly contagious disease of cattle and other cloven-footed animals, transmissible to man particularly through milk from affected animals, was much less prevalent in European countries than in 1911. The several outbreaks which occurred in Great Britain, including one in Ireland, resulted in the holding of the Royal Agricultural Show without cattle, sheep, or pigs. A departmental committee of 12 appointed by the president of the board of agriculture and fisheries to inquire into the disease made its report in the latter part of the summer. A German investigator, J. Siegel, isolated and cultivated a cytorhycte coccus, which appears to be the causative organism and to which the name *Cytorhyctes aphtharum* has been given.

DOURINE. The complement fixation test as applied to this disease, which was perfected during the year by the federal bureau of animal industry, makes it possible to diagnose dourine in a comparatively short time. Suspected cases in eastern Montana reported late in June were diagnosed in the Washington laboratory upon the receipt of blood sera from the suspected animal, four or five horses being found to have the disease. The occurrence of dourine in Brazil, where it is known as "mofo," was reported for the first time.

FOWL SPIROCHETOSIS. Hindle reported finding that when once the fowl tick becomes infected with *Spirochæta gallinarum*, the cause of the highly fatal disease of fowls known as spirochetosis, its offspring of the first generation is infective in all its stages, and, moreover, that infection is transmitted to the second generation.

ONCHOCERCIASIS. The infestation of the flanks and briskets of Australian beef cattle by the nematode *Spiroptera reticulata*, which forms the so-called "worm nests," became of considerable importance with the increase in the quantity of frozen meat exported to England.

BIBLIOGRAPHY. Some of the books or larger contributions that appeared during 1912 are as follows: H. Baum, *Das Lymphgefäßsystem des Rindes* (Berlin, 1912); F. Hutyra and J. Marek, *Special Pathology and Therapeutics of the Diseases of Domestic Animals* (Chicago, 1912, two volumes), a first English translation of the third edition of *Spezielle Pathologie und Therapie der Haustiere*; J. Marek, *Lehrbuch der klinischen Diagnostik der inneren Krankheiten der Haustiere* (Jena, 1912); V. A. Moore, *Principles of Microbiology: A Treatise on Bacteria, Fungi, and Protozoa Pathogenic for Domesticated Animals* (Ithaca, N. Y., 1912); M. Neveu-Lemaire, *Parasitologie des Animaux Domestiques: Maladies Parasitaires non Bactériennes* (Paris, 1912); and D. H. Udall, *Veterinarian's Handbook of Materia Medica and Therapeutics* (Ithaca, N. Y., 1912).

VICTOR EMMANUEL MONUMENT. See ARCHITECTURE.

VICTORIA. See MINIMUM WAGE.

VICTORIA. A state of the Commonwealth of Australia. Area, 87,884 square miles. Population (census of April 3, 1911), 1,315,551, exclusive of full-blooded aboriginals. Melbourne, the capital and temporary capital of Australia, had 103,593 inhabitants; with suburbs, 588,971. Governor in 1912, Sir John Michael Fleetwood Fuller (from May 24, 1911); premier, W. A. Watt. See AUSTRALIA.

VIRGINIA. POPULATION. According to the Census Bureau statistics compiled during 1912, out of the total population, 2,061,612 in the State in 1910, 26,628 were foreign-born whites, compared with 19,068 in 1900. Of these, the largest number, 4361, came from Russia; 4221 from Germany; 2450 from Ireland; 3676 from England, and 1604 from Austria. Other European countries are represented by smaller numbers. The negroes in the State numbered 671,096 and the mulattoes 222,910. In 1890 the negroes numbered 635,438 and the mulattoes 122,441.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1912 are given below:

		Acreage	Prod. Bu.	Value
Corn	1912	1,980,000	47,520,000
	1911	1,980,000	47,520,000	\$34,690,000
Wheat	1912	741,000	8,596,000	8,682,000
	1911	750,000	9,000,000	8,640,000
Oats	1912	175,000	3,885,000	2,020,000
	1911	194,000	3,880,000	2,095,000
Rye	1912	48,000	600,000	510,000
	1911	48,000	552,000	491,000
Potatoes ...	1912	95,000	8,265,000	5,372,000
	1911	95,000	4,275,000	4,104,000
Hay	1912	741,000	8,889,000	12,513,000
	1911	437,000	a280,000	5,740,000
Tobacco ...	1912	187,000	b112,200,000	13,464,000
	1911	160,000	b128,000,000	12,288,000

a Tons. b Pounds.

MINERAL PRODUCTION. The iron ore mined in the State in 1911 amounted to 610,871 long tons with a value of \$1,146,188, as compared with a product of 903,377 long tons in 1910 with a value of \$1,845,144.

The coal production of the State in 1911 was 6,864,667 short tons valued at \$6,254,804, compared with a product of 6,507,997 short tons valued at \$5,877,486 in 1910. All the important producing counties in the State, except Lee County, showed increases in production, the principal gains being due to developments in Russel County, following the completion in 1910 of the Carolina, Clinchfield, and Ohio Railroad and the opening of transportation from the mines to the South Atlantic seaboard.

MANUFACTURES. The Thirteenth Census statistics are for the calendar year 1909 and were compiled in 1912. Although the State does not rank among the first in manufactures, there has been a considerable advance during recent years. The following table shows that there were in 1909, 5685 establishments, employing 120,797 persons:

	Number or Amount 1909	1904	P. C. of Inc. 1904-'09
Number of establishments	5,685	3,187	78.4
Persons engaged in manufactures ..	120,797	88,898	35.9
Proprietors and firm members...	6,570	3,643	80.3
Salaried employees	8,551	4,970	72.1
Wage earners (average number) ..	105,676	80,285	31.6
Primary horsepower	283,928	176,998	60.4
Capital	\$216,392,000	\$147,989,000	46.2
Expenses	196,246,000	130,870,000	50.0
Services	47,255,000	32,818,000	44.0
Salaries	9,101,000	4,875,000	86.7
Wages	38,154,000	27,943,000	36.5
Materials	125,583,000	83,649,000	50.1
Miscellaneous	23,408,000	14,403,000	62.5
Value of products ..	219,794,000	148,857,000	47.7
Value of products less cost of materials	94,211,000	65,208,000	44.5

The largest value of product was in the manufacture of lumber and timber, \$35,855,000; tobacco manufacturers were valued at \$25,385,000; flour and gristmill products, \$17,598,000; industries relating to railways, \$9,956,000; manufactures of leather, \$8,267,000. The total number of persons engaged in manufactures in the State in 1909 was 120,797, of whom 104,662 were male and 16,135 female. The number of persons employed under 16 years of age was 3622. The prevailing hours of labor for 77 per cent. of the total number of wage-earners ranged from 54 to 60 a week; only 9.6 per cent. being employed in establishments where less than 54 a week prevailed, and 13.4 per cent. in those where they were more than 60 a week. The largest number of wage-earners was in Richmond, 14,849; in Norfolk, 4749; in Lynchburg, 4026. The value of the manufactures of Richmond was \$47,357,985; of Norfolk, \$10,341,321; and of Lynchburg, \$10,188,136.

FINANCE. The report of the treasurer for the fiscal year ending September 30, 1912, showed a balance on October 1, 1911, of \$350,601. The receipts for the fiscal year amounted to \$7,052,190 and the disbursements to \$707,178,395, leaving a balance on hand October 1, 1912, of \$224,396. The chief receipts are from taxation and the principal expenditures are for education and the maintenance of State institutions.

CHARITIES AND CORRECTIONS. Several important measures relating to charities and corrections were passed at the legislative session

of 1912. Among these was a measure putting into effect a very thorough vital statistics law. Money was appropriated to establish a State institution for the custodial care of feeble-minded children, and a law was passed providing surgical aid and treatment for indigent, crippled, and deformed persons. Woman and child labor laws were improved and the juvenile and adult probation laws were extended to include small towns and magisterial districts, and the State board of charities and corrections was given authority to place certain juvenile delinquents in family homes under supervision. All the State institutions were somewhat improved and the tuberculosis sanatorium was provided with funds for a well-equipped infirmary. During the year Richmond opened the first juvenile court in the State and the city charter has been amended so as to provide a workhouse to take the place of the old city jail. During the year several new private philanthropies came into existence. Among these was a movement on the part of the federated colored women's clubs to establish a much-needed reform school for colored girls. A housing commission in Richmond was planning to conduct a thorough survey of the city with recommendation for a more stringent housing code and its enforcement.

POLITICS AND GOVERNMENT

The legislature met in 1912 and the most important measures enacted will be found noted in the paragraph *Legislation* below. There was no election for governor and other State officers in 1912, as Governor Mann's term does not expire until January 31, 1914. He was elected in 1909, assuming office February 1, 1910, and the term of the governor of Virginia is four years.

A legislature (members of house) will be chosen in November next to begin its duties in January, 1914.

On March 2, the senate refused to pass the Jordan bill providing for referendum of the State-wide prohibition question to the vote of the people upon petition of 25 per cent. of the voters who cast their votes in the last gubernatorial election. The opposition to the bill was on the ground that it vested in a minority of the voters the question of State policy on public matters. The Republican convention for the election of delegates to the national convention met on February 19. The Republican party was divided into factions, and as a result, there were two conventions, one of which passed resolutions endorsing President Taft and elected delegates pledged to vote for him. The other faction declined to participate in the convention of the Republican regulars and held another convention at the same time. Uninstructed delegates were chosen. A majority of the Democratic delegates favored Governor Wilson, but the State convention refused to instruct for him.

The election on November 5 resulted as follows: Wilson, 90,332; Taft, 23,288; Roosevelt, 21,777; Debs, 820; Chafin, 709; and Reimer, 50. Governor Wilson's plurality was 67,061.

OTHER EVENTS. On March 14 a band of mountaineers shot and killed the judge, prosecutor, and sheriff at Hillsville, county seat of Carroll, just after the judge had pronounced sentence upon one of their number who had

been found guilty of a felony. The band dispersed to the hills, but finally all of its members were captured after a search which lasted for months. The participants in the shooting were all tried during the year and two, Floyd and Claude Allen (father and son), were sentenced to death and four others received terms of imprisonment ranging from 15 to 37 years.

LEGISLATION. An unusual number of important measures was passed at the legislative session of 1912. Among these were the following: Amendments to the law relating to corporations; the proposal of an amendment to the constitution as to special legislation for the organization of government of cities and towns; measures relating to the employment of convicts; amendments to the law relating to the sanitary arrangements in factories, workshops, etc.; an act to facilitate the development of the resources of the State by providing ways of ingress and egress for mining, manufacturing, and timber-cutting, and to authorize proper passways, tram-roads, and other means of transportation over the lands of others; an act to prohibit unauthorized hypnosis; an act to amend an act of the general assembly constituting a united agricultural board to coordinate the Virginia College of Agriculture and Polytechnic Institute and the Virginia Agricultural Experiment Station, the commissioner of the board of agriculture and the State board of education in cooperation with the United States Department of Agriculture for the betterment of agricultural, experimental, and demonstration work; an act to provide for the designation by cities and towns of segregation districts for the residence of white and colored persons; an elaborate drainage act; an act amending the general banking laws of the State; an act establishing a department of mines; a measure establishing a feeble-minded colony on the farm of the State epileptic colony; measures relating to taxation of railway and canal corporations; measures relating to the selling of liquor, providing for license, etc.; an act amending the act regulating the hours of labor in factories and manufacturing establishments, by providing that no female and no child under 14 years of age shall work as an operative in any factory, workshop, or any manufacturing establishment of the State for more than ten hours in any one day of 24 hours; an amendment to the act imposing upon railroad corporations liability for injuries to their employees in certain cases; an act providing for the holding of primary elections and for preventing and punishing corrupt practices in connection therewith. This act includes a primary for the nomination of United States senators and State officers, members of the house of delegates, and county and city officers, but does not extend to presidential electors. A measure was enacted dealing with the militia of the State. The law relating to the admission of children to the public schools was revised. A measure was passed providing for submission to the people of a proposed amendment to the section of the constitution as to special legislation for the organization and government of cities and towns.

STATE GOVERNMENT. Governor, William H. Mann; Lieutenant-Governor, J. T. Ellyson; Secretary of Commonwealth, B. O. James; First Auditor, C. Lee Moore; Treasurer, A. W. Harman, Jr.; Superintendent of Instruction, J. D.

Eggleston, Jr.; Attorney-General, Samuel W. Williams; Adjutant-General, W. W. Sale; Commissioner of Agriculture, George W. Koener; Commissioner of Insurance, Joseph Button—all Democrats.

JUDICIARY. Supreme Court of Appeals: President, James Keith; Justices, S. G. Whittle, John A. Buchanan, George M. Harrison, and Richard H. Cardwell; Clerk of the Court, H. Stewart Jones—all Democrats.

STATE LEGISLATURE, 1913. Democrats, Senate, 35; House, 90; joint ballot, 125. Independents and Republicans, Senate, 5; House, 10; joint ballot, 15. Democratic majority, Senate, 30; House, 80; joint ballot, 110.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

VIRGINIA, UNIVERSITY OF. A State institution of higher learning at Charlottesville, Va., founded in 1819. The enrollment in the various departments of the university on October 15, 1912, was 805. The faculty numbered 75. Several important changes in the faculty occurred during the year. Professor Ormond Stone of the chair of astronomy and Professor Milton W. Humphreys of the chair of Greek retired on the Carnegie Foundation. Professor R. H. Webb was appointed to the professorship of Greek, and Professor C. N. Wunder to the chair of astronomy. There were no noteworthy benefactions received during the year. The productive funds amounted at the close of the year 1911-12 to \$2,005,299. The income at the end of the year amounted to \$92,094. There were about 75,000 volumes in the library. President, E. A. Alderman, D. C. L., LL. D.

VIRGIN ISLANDS. A presidency of the Leeward Islands (q. v.). Tortola is the largest island (there are about 32); Road Town (in Tortola), the chief town, has 410 inhabitants. Cotton and some sugar are grown.

	1907-8	1908-9	1909-10	1910-11

Commissioner (1912), T. L. H. Jarvis. See **LEEWARD ISLANDS.**

VITALISM. See **BIOLOGY.**

VITAL STATISTICS. According to the commonwealth statistician of Australia, that country is the healthiest in the world, with the exception of New Zealand. In Australia, the death rate has steadily decreased from 15.75 per 1000 in 1884, to the present rate of 10.5. New Zealand has a still lower death rate, 9.75 per thousand. Infant mortality has shown a still more striking fall. In 1880 there were 130 deaths per 1000 births, as against the present rate of 71.

The latest available statistics from England, France, and Germany show a continued falling off in the number of births. The registrar-general's summary for 1911 indicates a fall in the birth-rate in England and Wales. The marriages registered last year numbered 274,577; corresponding to a rate of 15.2 per thousand of population. The number of births was 881,241, or 24.4 per thousand, and deaths numbered 527,864, or 14.6 per thousand. The mar-

riage-rate was 0.2 per thousand above that in the previous year, but 0.3 below the average for the preceding ten years. A decline of 0.7 per thousand is recorded in the birth-rate when compared with that of 1910, which was the lowest on record; and last year's rate was 2.8 below the average of the preceding ten years. The death-rate was 1.1 above that in 1910, but was 0.8 below the average for the preceding ten years. Infantile mortality, measured by the proportion of deaths under one year to registered births, was 130 per thousand, or twenty-five above the rate in 1910 and three above the ten years' average. Deaths attributed to violence numbered 20,103, a rate of 0.26 per thousand of population.

The *Journal Officiel* published very discouraging statistics on the French population in 1911. In 1911, there was an excess of 34,869 deaths, while the year before there was an excess of 71,418 births. The difference is due to the diminution of births (742,114 infants reported living in 1911, against 774,390 in 1910), and, to the increase in the number of deaths (74,011 greater in 1911 than in 1910). The deaths have been more numerous in 1911 than in 1910 in almost all the departments, but notably in Normandy. The increase in the proportional number of deaths in France as compared with other countries is attributed partly to the great number of aged people, but chiefly to the small birth-rate in recent years. Although the birth-rate is low, the number of marriages is relatively large. In 1911, 307,788 marriages were registered. The number of divorces reached 13,058, slightly more than in 1910.

A summary given by the German imperial bureau of statistics shows that the births for 1910, including still births, amounted to 1,982,836, as compared with 2,038,357 in 1909, and 2,076,660 in 1908. While the births fell in 1909 by 38,300, the reduction in 1910 was by 55,500. For the first time since 1897 the number of births has fallen below two millions. In 1910 there were 30.7 births per 1000 inhabitants. The rate has never been so small in the last sixty years; it has been sinking for a long time after reaching its highest point in the seventies. From 1851 to 1860, the birth-rate for the present area of the German empire was 36.8 per 1000 inhabitants, from 1861 to 1870, 38.8, from 1871 to 1880, 40.7 (with a maximum of 42.6 in the year 1876), from 1881 to 1890, 38.2, from 1891 to 1900, 37.4, from 1901 to 1910, 34.0. The reduction in the last decade has been marked. In 1908 the rate was 33, in 1909, 31.9. The rate of illegitimate births has been rising since 1903, following a previous fall; in 1903 there were in 100 births 8.3 illegitimate, in 1909, 9, and in 1910, 9.1. With the reduction in births, however, there has also been a reduction in deaths; in 1910 there were 1,103,723 as compared with 1,154,296 in 1909 and 1,197,098 in 1908. As compared with the population the mortality of 17.1 per 1000 has never been so low. In 1909 the rate was 18.1, in 1908, 19, and in the decade from 1901 to 1910 it was 19.5, as compared with 23.5, 26.5, 28.8, 28.4, and 27.8 in the preceding five decades.

The following statistics as to contagious diseases throughout the world have been compiled from the United States Marine Hospital Service reports. While in many instances in-

complete and misleading, they are the best obtainable:

SMALLPOX. Algeria, 153 cases, 3 deaths; Arabia, 23 cases, 12 deaths; Argentina, 44 deaths; Austro-Hungary, 146 cases, 1 death; Brazil, 1122 deaths; British East Africa, 16 cases, 3 deaths; Canada, 653 cases, 4 deaths; Ceylon, 4 cases; Chile, 1193 cases, 412 deaths; China, 844 cases, 616 deaths; Cuba, 2 cases; Dutch East Indies, 283 cases, 106 deaths; Egypt, 37 cases, 13 deaths; France, 164 cases, 25 deaths; Germany, 10 cases; Great Britain, 26 cases, 2 deaths; Honduras, 37 cases; India, 2446 cases, 1360 deaths; Indo China, 71 cases, 18 deaths; Italy, 3078 cases, 944 deaths; Japan, 39 cases, 3 deaths; Mexico, 1242 cases, 675 deaths; Portugal, 175 cases; Russia, 1172 cases, 372 deaths; Siam, 2361 deaths; South Africa, 135 cases, 4 deaths; Spain, 558 cases, 374 deaths; Straits Settlements, 73 cases, 33 deaths; Switzerland, 20 cases; Teneriffe, 54 deaths; Turkey in Asia, 1733 cases, 124 deaths; Turkey in Europe, 570 deaths; Uruguay, 26 cases, 4 deaths; Venezuela, 16 cases, 2 deaths; Zanzibar, 5 cases, 4 deaths.

PLAGUE. Algeria, 8 cases, 8 deaths; Arabia, 3 cases, 2 deaths; Azores, 35 cases, 21 deaths; Brazil, 47 cases, 36 deaths; British East Africa, 69 cases, 14 deaths; Chile, 69 cases, 28 deaths; China, 2062 cases, 1747 deaths; Dutch East Indies, 595 cases, 527 deaths; Ecuador, 325 cases, 123 deaths; Egypt, 845 cases, 423 deaths; Hawaii, 5 cases, 5 deaths; India, 368,017 cases, 306,748 deaths; Indo China, 171 cases, 82 deaths; Japan, 191 cases, 144 deaths; Mauritius, 247 cases, 147 deaths; Persia, 988 cases, 629 deaths; Peru, 50 cases, 13 deaths; Philippine Islands, 23 cases, 22 deaths; Porto Rico, 56 cases, 29 deaths; Russian Empire, 298 cases, 266 deaths; Siam, 8 deaths; South Africa, 28 cases, 23 deaths; Straits Settlements, 52 cases, 40 deaths; Turkey in Asia, 26 cases, 17 deaths; Venezuela, 11 cases, 6 deaths; West India, 10 cases, 8 deaths.

CHOLERA. Arabia, 22 cases, 12 deaths; Austro-Hungary, 75 cases, 17 deaths; Bahrein Islands, Persian Gulf, 260 deaths; China, 113 deaths; Dutch East Indies, 626 cases, 510 deaths; India, 4770 deaths; Indo China, 2538 cases, 1856 deaths; Italy, 196 cases, 95 deaths; Japan, 13,555 cases, 139 deaths; Malta, 6 cases, 6 deaths; Montenegro, 9 cases, 5 deaths; Persia, 38 deaths; Philippine Islands, 5 cases, 5 deaths; Rumania, 154 cases, 18 deaths; Servia, 6 cases, 4 deaths; Siam, 2811 deaths; Straits Settlements, 109 cases, 98 deaths; Tunis, 80 cases, 35 deaths; Turkey in Asia, 4169 cases, 3253 deaths; Turkey in Europe, 330 cases, 126 deaths; Zanzibar, 155 cases, 125 deaths.

YELLOW FEVER. Brazil, 164 deaths; Chile, 1134 cases, 391 deaths; Ecuador, 347 cases, 174 deaths; Mexico, 81 cases, 35 deaths; Peru, 43 deaths; Venezuela, 54 cases, 14 deaths.

VIVISECTION. The report of the Royal Commission on Vivisection appointed in 1906 and consisting principally of eminent British physicians and lawyers, to inquire into and report on the law relating to vivisection and its administration, was published early in 1912. More than seventy meetings were held, at which a large number of witnesses were examined. The commission was freely accessible to all persons who were or believed themselves to be in a position to criticise the practice of vivisection. The allegations of a number of

active anti-vivisectionists were examined and found to have no basis in fact. The commissioners believe that the holders of licenses and certificates for vivisection, with rare exceptions, have endeavored, with loyalty and good faith, to conform to the provisions of the law, and that the harrowing descriptions and illustrations of operations on animals, are calculated to mislead the public, so far as they suggest that the animals are not under an anæsthetic. Twenty-five pages of the report are devoted to the recent history of the progress of medical science in connection with experiments on animals, and to the question whether or not these give valuable results in the prevention and cure of disease. The commissioners point out that in recent years the value of the experimental method has largely been recognized by the public, as well as by various public bodies, as is shown by the foundation of schools of tropical medicine and the appointment of research expeditions to investigate on the spot various tropical diseases, the foundation of an imperial research fund for the purpose of investigating cancer and the appointment of a royal commission to study tuberculosis by experimental methods.

On the question of the morality of vivisection, the commissioners conclude that experiments on animals, adequately safeguarded by law, are morally justifiable. A number of recommendations are made, with which the anti-vivisectionists express some satisfaction: (1) Further limitation with regard to curare, during the use of which an inspector should be present, and see that the animal is in a state of complete anæsthesia; (2) stricter provision as to the definition and practice of pithing, which should be performed only by a licensed person and under an adequate anæsthetic; (3) additional restrictions regulating the painless destruction of animals which show signs of suffering after experiments; (4) the keeping of special records by experimenters in certain cases; (5) an inspector should have the power to order the painless destruction of any animal after experiment which shows signs of obvious suffering, even though the object of the experiment has not been attained. A minority report is made by three of the commissioners, who recommend that the administration of an anæsthetic shall be obligatory in all experiments likely to cause pain, or, if the nature of the investigation render this impossible, then on the supervision of real or obvious suffering, the animal shall be killed.

VOLCANISM. See GEOLOGY.

VOLCANOES. There were few volcanic outbursts in 1912 that involved any very remarkable features or widespread damage to life and property. In the Mediterranean region, the scene of considerable activity during the few preceding years, conditions generally were normal, so far as they have been reported. Mt. Etna, after its display of 1911, resumed its usual state, but Stromboli developed great energy during the latter part of September and

for a time threatened to lay waste the island on which it is situated. The upper slopes of the volcano were buried beneath a thick ash mantle and some agricultural lands were damaged badly, but no casualties were reported. Taal volcano, in the Philippines, remained quiet; this crater in 1911 wrought great destruction upon the district to the south of Manila. The most forcible eruption of the year was that of Katmai volcano in Alaska, a crater not previously known to have been active and considered by the natives as extinct. The volcano, which is situated on the coast of Alaska Peninsula, near the base, suddenly displayed violence on June 6, without any warning unless the earthquakes reported from Alaska earlier in the year were premonitory of the outbreak. For two days dust, ashes, and steam clouds poured out unceasingly, shrouding the region for miles around in total darkness. The village of St. Paul and other settlements on the island of Kodiak, across Shelikof strait from the volcano, were damaged by the fall of ashes that accumulated to a depth of several feet. The principal loss was involved in the destruction of vegetation and the injury to the fishing industry through pollution of the streams by the acid ejecta. Mt. Wrangell, the most noted of the Alaskan volcanoes, was reported in eruption in September.

WALTON, CLIFFORD STEVENS. An American lawyer, author, and public official, died in May, 1912. He was born in Chardon, O., in 1861, and was educated at the United States Military Academy and at the University of Madrid, Spain, where he studied law. He became proficient in international law and served as attorney for and against the United States in several international law matters, including controversies between the United States and Chile, Peru, Salvador, etc. In 1898-9 he was major of the United States volunteers on the staffs of Major-Generals Brooke and Ludlow in Porto Rico and Cuba. He was for several years consul-general of the United States in Portugal. He was a member of many patriotic and legal associations. Among his writings on international law were: *The Civil Law in Spain and Spanish America* (1900); *Commercial and Maritime Laws of Spanish America* (1907). He also contributed articles on law to law journals and wrote several sketches of Spanish life. He was said to be the only native American lawyer who was a licentiate in Spanish law.

WARREN, HENRY WHITE. An American bishop of the Methodist Episcopal Church, died July, 1912. He was born in Williamsburg, Mass., in 1831, and graduated from Wesleyan University in 1853. For several years he taught science and languages and in 1855 was ordained to the ministry. He filled pastorates at Worcester, Boston, Lynn, Cambridge, Brooklyn, and Philadelphia. In 1880 he was elected bishop. He was the author of *Sights and Insights* (1874); *Studies of the Stars* (1878); *Recreations in Astronomy* (1879); *The Bible in the World's Education* (1892); *Among the Forces*

(1898), and many articles in newspapers and reviews.

WASHBURN, WILLIAM DREW. An American flour miller and former United States Senator from Minnesota, died July 29, 1912. He was born in Livermore, Me., in 1831, and graduated from Bowdoin College in 1854. In 1857 he removed to Minnesota and engaged in the practice of law. He became largely interested in flour manufacture and lumber enterprises and was for years interested in the Washburn and Crosby flouring mills, and later stockholder and director in the Pillsbury-Washburn Company. He was promoter and president for many years of the Minneapolis and St. Louis Railway and was also projector and builder of the Minneapolis, St. Paul and Sault Ste. Marie Railway, of which he was president until 1889. He was twice a member of the Minnesota House of Representatives and was surveyor of the State from 1861 to 1865. He was a member of the Forty-sixth and Forty-eighth Congresses and was United States Senator from Minnesota from 1889 to 1895.

WASHINGTON. POPULATION. According to the Census Bureau statistics compiled during 1912, out of the total population in 1910, of 1,141,990, the foreign-born whites numbered 241,237 compared with 102,125 in 1900. Of these, the largest number, 35,271 came from Canada; from Sweden, 32,011; from England, 19,397; from Norway, 28,363; from Austria, 12,725; from Italy, 13,114. Other European countries contributed in smaller numbers. In the city of Seattle, with a population of 237,194, the foreign-born whites numbered 60,825. In Spokane, with a population of 104,402, the foreign-born whites numbered 21,260. The negroes in the State in 1910 numbered 6058 and the mulattoes 1840. In 1890 the negroes numbered 1602 and the mulattoes, 558.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1912 are shown below:

		Acreage	Prod. Bu.	Value
Corn	1912	31,000	846,000	\$ 651,000
	1911	30,000	855,000	675,000
Wheat	1912	2,285,000	53,728,000	36,535,000
	1911	2,230,000	50,661,000	35,969,000
Oats	1912	284,000	13,659,000	5,476,000
	1911	281,000	14,528,000	6,538,000
Rye	1912	9,000	180,000	117,000
	1911	8,000	176,000	141,000
Potatoes	1912	68,000	11,356,000	4,088,000
	1911	59,000	9,440,000	6,419,000
Hay	1912	776,000	a 1,707,000	17,241,000
	1911	400,000	a 960,000	11,520,000

a Tons.

MINERAL PRODUCTION. The gold production of the State in 1911 was \$847,677, compared with \$788,185 in 1910. This is the largest output since 1903. The output and increase are mainly due to the Republic district of Ferry County. The silver output of the State in 1911 was 243,781 fine ounces, compared with 205,345 fine ounces in 1910. The production was mainly from siliceous smelting ores from Ferry County and copper and lead ores from Stevens County.

The production of coal in the State in 1911 was 3,572,815 short tons valued at \$8,174,170. Washington is the only one of the Pacific coast States in which coal-mining is an industry of any importance. The output of 1911 showed a decrease from that of 1910 by

339,084 tons in quantity and \$1,590,295 in value. The decrease is due almost entirely to the increased use of oil for fuel. The number of men employed in the coal mines of the State was 6498. There were 25 men killed in the coal mines of the State in 1911.

The value of the gold, silver, copper, lead, and zinc produced in the State in 1911 was \$1,056,017, compared with a value of \$968,249 in 1910. The production of gold was \$847,677, which is the largest output for many years. The silver product in 1911, 243,781 fine ounces, was larger than the output of any year since 1903, and exceeded the production of 1910 by 38,436 ounces. The copper production increased from 86,918 pounds in 1910 to 318,207 pounds in 1911. The output of lead was 848,584 pounds, a decrease of 473,703 pounds from the production of 1910.

MANUFACTURES. The chief results of the census of manufactures, taken in 1910, are shown in the following table, together with the percentage of increases from 1904-1909:

	Number or Amount 1909	1904	P. C. of Inc. 1904-'09
Number of establishments	3,674	2,751	33.6
Persons engaged in manufactures ..	80,118	51,459	55.7
Proprietors and firm members...	3,264	2,602	25.4
Salaried employees.	7,734	3,658	111.4
Wage earners (average number)...	69,120	45,199	52.9
Primary horsepower	297,897	168,342	77.0
Capital	\$222,261,000	\$ 96,953,000	129.2
Expenses	196,275,000	111,381,000	76.2
Services	59,593,000	34,180,000	74.4
Salaries	9,827,000	4,093,000	140.1
Wages	49,766,000	30,087,000	65.4
Materials	117,888,000	66,166,000	78.2
Miscellaneous	18,794,000	11,035,000	70.8
Value of products...	220,746,000	128,822,000	71.4
Value added by manufacture (value of products less cost of materials)	102,858,000	62,656,000	64.2

The chief manufacturing industries of the State are those relating to lumber and timber products. In these, 43,749 wage-earners were employed in 1910 and the value of their product was \$89,155,000; in flour-mill and gristmill products 644 wage-earners were employed and the product was valued at \$17,853,000; in slaughtering and meat-packing, 828 wage-earners were employed and the product was valued at \$15,654,000; in canning and preserving, 2029 persons were employed with a product valued at \$9,595,000; in printing and publishing, 2624 persons were employed with a product valued at \$9,286,000; in foundry and machine shop products, 2439 persons were employed, with a product valued at \$7,988,000. Other industries, the value of whose product was more than \$5,000,000, were the manufacture of butter, cheese, and condensed milk, and the brewing of malt liquors. The total number of wage-earners in the State in 1909 was 69,120, of whom 2859 were women. The wage-earners under 16 years of age numbered 266, and of these 47 were females. For over 70 per cent. of the wage-earners employed the prevailing hours of labor were 60 a week. This large percentage was explained by the general prevalence of 60 hours a week in the predominant lumber industry. The largest number of wage-earners

was in Seattle, 11,331, and the value of the manufactured products was \$50,569,198; in Tacoma were 5765 wage-earners and the value of the products was \$22,449,979; in Spokane, 3989 wage-earners were employed and the products were valued at \$18,879,591. Other important manufacturing centres were Everett, Bellingham, Aberdeen, Walla Walla, and North Yakima.

EDUCATION. The number of children of school age in the State on May 1, 1912, was 283,141. The enrollment in the public schools was 224,405, and the average daily attendance was 170,036. The teachers employed numbered 8041, of whom 6496 were females, and 1545 males. The average salary paid to male teachers per month was \$87.25 and to female teachers, \$67.80. The high schools numbered 410.

FINANCE. The receipts for the biennial period ending September 30, 1912, amounted to \$16,911,514, and the expenditures to \$15,711,107, leaving, with the balance on hand at the beginning of the fiscal year, a balance of \$2,446,247 at the end of the fiscal year. The general fund of the State has no debts. The State owns in bonds belonging to six permanent irreducible funds, \$9,920,020, which nets the State in interest \$1250 a day for each day in the year.

POLITICS AND GOVERNMENT

The legislature did not meet in 1912, as the sessions are biennial and the last was held in 1911. The next session convenes January 8, 1913. Elections for State officers were held in 1912. The contest over the Washington delegates was one of the most bitterly fought before the national committee at Chicago at the Republican national convention. It will be found fully described in the article **PRESIDENTIAL CAMPAIGN**. The delegates from the State were finally awarded to President Taft. The Democratic delegates were instructed to vote for Governor Wilson. Governor Hay was renominated by the Republican party for governor, and the Progressives nominated Robert D. Hodge. The Democratic nominee was Ernest Lister. These were nominated in the State primaries held on September 10. The election of November 5 resulted as follows: Roosevelt, 111,797; Wilson, 87,674; Taft, 71,252; Debs, 39,555; Chafin, 7467; and Reimer, 1872. Roosevelt's plurality was 24,123. For governor, Lister, Dem., received 97,239 votes; Hay, Rep., 96,813, and Hodge, Prog., 77,873. The Democrats, Republicans, and Progressives each elected one congressman-at-large. The next State legislature will contain 27 Democrats; 77 Republicans; 33 Progressives; and 1 Socialist.

MUNICIPAL POLITICS. The application of the principle of recall furnished the chief local political interest in the State during 1912, aside from the presidential and gubernatorial campaigns. On February 20, Hiram C. Gill was nominated for mayor of Seattle. He had been elected mayor in 1910 and was recalled before he had served a year, although in the primaries for nomination he received 24,630 votes, while his closest competitor had 14,221. The Socialists polled in this election about 10,841 votes. Although Mr. Gill had received the nomination by a substantial majority, in the election held on March 6 he was defeated by George F. Cotterill by a majority of 804 votes.

The defeat of Mr. Gill was attributed to the vote of the women. He had been bitterly opposed by women's clubs and by the church element of the city. Mr. Cotterill ran on the platform of municipal ownership and single tax. Nevertheless, the single tax amendment to the charter, which was printed on the same ballot, was overwhelmingly defeated. The total vote for Cotterill was 32,085 and for Gill, 31,281. An attempt was made in March to bring about the recall of the mayor of Tacoma, but this met with failure. A complaint was filed, but it was found impossible to secure a sufficient number of names to bring about the election for the recall. The League of Washington Municipalities met in convention at Wenatchee, December 12-14, and defined a home rule programme for the next session of the legislature.

THE OLESON CASE. The decision rendered by Judge C. H. Hanford of Washington, revoking the citizenship papers of one Leonard Oleson on the ground that he was a Socialist, attracted wide attention and resulted in the introduction of a resolution in Congress by Mr. Berger, the Socialist member of Congress, for the impeachment of Judge Hanford. Judge Hanford subsequently resigned his office and therefore it was not necessary to bring the charges to an issue. In a statement of his defense given to the press, Judge Hanford declared that the reason for his ruling was not to be found in the character of Oleson or in any alleged misdeeds done by him. He said that "Oleson admitted that he is a Socialist and a frequenter of assemblages of Socialists in which he participates as speaker, advocating a propaganda for radical changes in the institutions of the country." He further affirmed that Oleson was affiliated with a party whose main object is "the complete elimination of property rights in this country." Furthermore, Oleson insisted that all the land, buildings, and industrial institutions should become the common property of all the people, that when this is done through the ballot there will be no more use for the political government of the country. Judge Hanford added that "those who believe in the propagation of crude theories hostile to the constitution are barred" and the privilege of becoming naturalized is restricted to "those whose sentiments are compatible with genuine allegiance to the existing government as defined by the oath which they are required to take." He concludes his statement as follows: "In order to secure a certificate of naturalization he intentionally made representations to the court which necessarily deceived the court, or his application for naturalization would have been denied. Therefore, by the petition which he was required to file and his testimony at the final hearing of his application, and by taking the oath which was administered to him in open court, he perpetrated a fraud upon the United States and committed an offense for which he may be punished as provided by law. The case, therefore, comes clearly within the provision of the law requiring the court to set aside and cancel his certificate of naturalization, and it was so decreed." Judge Hanford's decision was widely criticised and Attorney-General Wickersham expressed his opinion that Oleson had been unjustly treated.

STATE GOVERNMENT. Governor, Ernest Lister; Lieutenant-Governor, Louis Hart; Secretary of State, I. M. Howell; Treasurer, Edward

Meath; Auditor, C. W. Clausen; Superintendent of Education, J. P. Preston; Attorney-General, V. W. Tanner—all Republicans except the governor.

JUDICIARY. Supreme Court: Chief Justice, R. O. Dunbar; Associate Justices, O. G. Ellis, H. D. Crow, M. A. Fullerton, W. Mount, M. F. Gose, S. J. Chadwick, George E. Morris and Emmett N. Parker—all Republicans, except Chadwick; Clerk, C. S. Reinhart.

STATE LEGISLATURE, 1913. Republicans, Senate, 27; House, 48; joint ballot, 75. Democrats, Senate, 7; House, 18; joint ballot, 25. Progressives, Senate, 7; House, 30; joint ballot, 37. Republican majority, Senate, 13; joint ballot, 13.

The representatives in Congress will be found in the article UNITED STATES, section Congress.

WASHINGTON ACADEMY OF SCIENCES. A society organized for the assistance of research and the prosecution of any business pertinent to an academy of sciences, founded in 1898. It acts as a federal head for the affiliated societies, which, with their vice-presidents in 1912, were as follows: Anthropological Society, F. W. Hodge; Archaeological Society, Mitchell Carroll; Biological Society, E. W. Nelson; Botanical Society, W. R. Maxon; Chemical Society, J. A. Le Clerc; Engineers Society, G. W. Littlehales; Entomological Society, A. L. Quaintance; Foresters Society, H. S. Graves; Geographic Society, Henry Gannett; Geological Society, David White; Historical Society, James Dudley Morgan; Medical Society, John B. Nichols; Philosophical Society, E. B. Rosa. Three scientific meetings were held during 1912. These dealt with sound waves, the recent work of the Carnegie, the total solar eclipse of April 28, 1911, and with an exhibit of new and interesting apparatus from the United States government and other scientific laboratories of Washington. The president in 1912 was F. V. Coville. The society publishes the *Journal of the Washington Academy of Sciences*.

WASHINGTON UNIVERSITY. An institution for higher education at St. Louis, Mo., founded in 1853. The total number of students in all departments of the university in the autumn of 1912 was 1326. The faculty numbered 147. There were no noteworthy changes in the faculty during the year and no noteworthy benefactions. The productive funds of the university amounted to \$6,697,590 and the income to \$598,963. The library contained about 130,000 volumes. Chancellor, David F. Houston.

WASHINGTON, UNIVERSITY OF. A State institution of higher education at Seattle, Wash., founded in 1861. The number of students enrolled in the various departments of the university in the collegiate year 1911-12 was 2632. The faculty numbered 143. Among the noteworthy changes in the faculty during the year were the following: Professor Frederick E. Bolton of the University of Iowa was appointed head of the department of education in place of Dr. E. O. Sisson, resigned; Dr. Edwin J. Vickner of Gustavus Adolphus College was appointed head of the department of Scandinavian languages; Miss Effie I. Raitt, formerly of Northwestern University, was appointed head of the department of home economics; Dr. Samuel L. Boothroyd, formerly of Cornell University, was appointed to the chair of astronomy in place of Associate Professor James Gould, resigned; Associate Professor Lee

Emerson Bassett, formerly of Stanford University, was given charge of public speaking and debate. During the year an extension division was established, with Professor Edwin A. Start in charge. The largest gift during the year was a set of chimes, consisting of 12 bells, costing \$12,500, presented by Colonel Alden J. Blethen, a former regent of the university. The income of the university is derived from 100,000 acres of land, with a minimum selling price fixed by law of \$10 an acre, \$1,000,000, and a tract of land in the business district of Seattle valued at \$2,000,000. The amount furnished by the State annually for the support of the university is about \$475,000. The library contains 51,163 volumes. President, Thomas F. Kane, Ph. D.

WASHINGTON AND LEE UNIVERSITY.

An institution for higher learning at Lexington, Va., founded in 1749. The students enrolled in the autumn of 1912 numbered 470, divided as follows: Academic department, 263; engineering department, 59; law department, 149. The faculty numbered 26. Professor R. M. Withers was appointed to the Bradford chair of international and constitutional law in the law school. The university received \$10,000 under the will of Frank T. Howard, an alumnus, of New Orleans, La. The productive funds of the university amounted at the end of the year 1911-12 to \$893,979. The annual income is about \$95,000. There were 50,000 volumes in the library. President, George H. Denny, LL. D., Ph. D.

WASSERMAN'S EXPERIMENTS. See CANCER.

WATER POLLUTION. See SANITATION.

WATER PURIFICATION. The use of hypochlorite of lime (bleaching powder or chloride of lime) or else hypochlorite of soda for water disinfection continues to make marvelous progress. The practice was begun a few years ago, chiefly as an emergency measure in case of typhoid outbreaks due to unfiltered, polluted water. It was continued as a temporary protection against typhoid pending the construction of filters. Then it was taken up as an adjunct to mechanical filtration and gradually as supplementary to slow sand filtration, and then to sedimentation as well. Rapidly the larger cities of the United States, and also the smaller ones, are coming to disinfect their water-supplies by this means, when those supplies are from surface sources. Minneapolis, Minn., virtually completed a large water mechanical filter plant, with provision for using hypochlorite, in 1912. The use of ozone for disinfection is slowly extending in Europe, but is making little headway in this country. The cost is still high, the working of the apparatus somewhat uncertain, and as a rule, the water must be filtered before the ozone is applied. The ultra-violet ray process is as yet in its infancy.

WATER SUPPLIES, STATE CONTROL OF. See SANITATION.

WATER SUPPLY. See AQUEDUCTS.

WATERWAYS, STANDARD OF PURITY FOR. See SANITATION.

WATER-WORKS. Important studies of water waste were made at Chicago and a water conservation exhibition, designed to educate the public against the almost criminal waste of water at Philadelphia, were features of the year. Baltimore and San Francisco installed

special high-pressure water-works systems for fire protection. Aside from its high-pressure system, San Francisco still depends on a private company for water, after every other large city has built or bought works. The San Francisco project for a great municipal gravity water-supply from the headwaters of the Tuolumne River, involving a huge dam in the Hetch Hetchy Valley and a long and large aqueduct, is still in abeyance. A large engineering report on the project, presenting a scheme of greater magnitude than the earlier ones, was made by John R. Freeman, and published by the city. The Spring Valley Water Company issued two volumes designed to show that its present and projected works are all sufficient for scores of years to come. Opponents of flooding the Hetchy Valley, which lies in the Yosemite National Park, had their innings in November, 1912, before Secretary of the Interior Walter Fisher, to whom the reports already mentioned were made. The secretary, aided by a board of advisory engineers (U. S. army), will decide in 1913 whether San Francisco's need of the Hetch Hetchy supply is great enough to warrant the flooding of the valley, for which a conditional, but deferred, permit was granted by ex-Secretary Garfield a few years ago. See SANITATION, *Sewage Purification*.

WATSON, JAMES E. See PRESIDENTIAL CAMPAIGN.

WATSON, ROSAMUND (BALL) MARRIOTT. An English poet, died January, 1912. She was born in 1863 and was the wife of H. B. Marriott Watson, the English novelist. Among her publications are: *The Ballad of the Bird-Bride, and Other Poems; A Summer Night, and Other Poems; The Art of the House* (1896); *After Sunset* (1903); and *The Heart of a Garden* (1905). She was a contributor of poetry to many magazines.

WEATHER CONDITIONS. See METEOROLOGY.

WEAVER, JAMES B. An American soldier and political writer, died February 6, 1912. He was born in Dayton, O., in 1833, and his early education was obtained from the public schools. He studied law and in 1854 was admitted to the bar. At the outbreak of the Civil War he had joined the Iowa volunteers as a private, and when the war began he was made a colonel of this regiment. He attained the rank of brigadier-general. After the war he resumed the study of law and entered politics. In 1866 he was elected district-attorney of the second judicial district of Iowa and served in this office for four years. In 1867 he became assessor of internal revenue for the first district of Iowa, holding this office for four years. He was for several years editor of the *Iowa Tribune*. In 1879 he was elected to the Forty-sixth Congress as a Greenbacker. He was also elected to the Forty-ninth and Fiftieth Congresses in 1885-89. He was the candidate for the presidency on the Greenback ticket in 1880, and was again candidate for the presidency in 1892 by the People's party. He received twenty-two electoral votes. From 1904 to 1906 he was mayor of Colfax, Ia.

WEEDEN, WILLIAM BABCOCK. An American soldier, manufacturer, and writer, died March 28, 1912. He was born in Bristol, R. I., in 1834, and studied at Brown University from 1848 to 1850. In 1851 he engaged in the busi-

ness of manufacturing woolens. At the outbreak of the Civil War he enlisted as first lieutenant of artillery in the United States volunteers. He participated in many battles and rose to be chief of artillery in the 1st division of the 5th Corps. He resigned from the service in August, 1862, and resumed business in Providence. He retired from active business in 1902. He was the author of *Morality of Prohibitory Liquor Laws* (1875); *Social Law of Labor* (1882); *Economic and Social History of New England, 1620-1789* (1890), and *War Government, Federal and State* (1906).

WEEVIL. See COTTON.

WEIGHTS AND MEASURES. UNITED STATES LEGISLATION. In 1912 the legislature of the State of New York passed a bill which became Chapter 81 of the Laws of 1912, relating to the sale of commodities. This gave what is said to be one of the broadest weights and measures laws in existence anywhere. It applied to all commodities and provided that whoever sells any commodity whatsoever must make a written representation of the quantity. The statute provided that the State superintendent of weights and measures, with the co-operation of the chief and principal weights and measures officials of first-class cities, should establish tolerances, rules, and regulations for carrying out the provisions of the act, and a board so established during the year issued the preliminary regulations and requirements demanded under the act. The laws of 1912 also contained statutes dealing with the method of selling meat products and butter, and prescribed the sizes of the containers for various vegetable products and fruit. This act required the net contents of containers to be indicated on the outside, and provided for the immunity from prosecution of any person who could show a guarantee signed by a wholesaler, jobber, or manufacturer from whom the commodity was purchased, to the effect that the person guaranteeing in the first instance then became amenable to prosecution, fines, and other penalties. The attorney-general of the State of New York decided that it was not legal under the terms of the new statute for a dealer to place on his package in connection with the statement of the weight of its contents, the word "average," with or without other qualifying clause.

METRIC SYSTEM; RECENT PROGRESS. Successful progress was made in 1912 in the adoption of the metrical system of weights and measures either as an obligatory or permissive system. On April 1, the law of Denmark, promulgated on May 4, 1907, went definitely into effect. Henceforth the metric units are exclusively to be employed in that country except for the agricultural measures for which the application is still deferred. The new system has been employed without detriment and to general satisfaction. A convention signed at Tegucigalpa February 3, 1910, by the delegates of the five republics, Costa Rica, Guatemala, Honduras, Nicaragua, and Salvador, provided for the complete application on January 1, 1912, of the metric system. As to the methods of the reform information, unhappily, was lacking. In the kingdom of Siam metric units had already been adopted for certain applications, notably in public works, and it is interesting to note that according to a report addressed to the government of Lord Salisbury, the English engineers

in the service of the Siamese government at that time declared themselves invariably well satisfied with its use and did not desire to return to the British system of weights and measures. In 1910 the Siamese government decided to adopt the metrical system for all uses and successively to render it obligatory in each of the provinces according as the machinery should be created for its application. Since it has taken that position the government of Siam has made great efforts to hasten the moment when the system may be applied throughout the whole country. In 1908 the imperial Chinese government decided upon the adoption of a system of measures that was, in great part decimal, and in which the unit of length was by definition equal to 32 centimeters, showing thus its intention of preparing by an intermediate stage for complete metrical reform. Such reform is in process of realization. The government of the Chinese Republic presented in effect to the Chambers a bill providing for the immediate and obligatory employment of the metric system. Without waiting for a vote on that bill the Peking government began preparatory studies in order to take a definite step in the reform. The British colonies have not remained behind in the movement for the adoption of decimal measures. At Malta the complete application of the metric system was decided upon in December, 1910, to become effective at the beginning of January, 1912. On the latter date, however, it was deferred until July, 1912, and finally to July 1, 1913. On August 4 the Australian house of representatives decided to propose to the imperial conference the obligatory employment of the metric system in all the British Empire and if this result could not be obtained, to agree with New Zealand to adopt it without delay. The Imperial conference did not see fit to follow the suggestions of the Australian parliament and it seemed probable that the second part of the decision of the house would soon go into effect. The Union of South Africa has taken an equally important step toward the adoption of the metric system by the elaboration of a bill published on February 10, 1912, in the *Union Gazette Extraordinary* and of which the first article is couched in the following language: "From a date to be fixed by the governor-general by proclamation in the *Gazette*, the lawful and standard measures of weight capacity (or volume), length, superficial area and cubic content shall, throughout the Union, be those described in the second schedule to this act and no other." The second schedule provided in the first place for metric measures; in the second place, for British measures and those of the Dutch colonists. Thus it is the undisguised intention of the legislature to give preponderance to the metric system.

Besides these accessions either actual or in preparation which have just been enumerated, it is interesting to note that there have been other adoptions of the metric system of which the most important are those in Bosnia-Herzegovina and Belgian Congo. The adherents to the metric system already make a long list, which is as follows: Austria, Argentina, Belgium, Brazil, Bulgaria, Chile, Colombia, Costa Rica, Cuba, Denmark, France, Germany, Guatemala, Honduras, Hungary, Italy, Luxembourg, Mexico, Montenegro, Netherlands, Nicaragua, Norway, Peru, Rumania, Salvador, Ser-

via, Spain, Sweden, Switzerland, and Uruguay. The inclusion of Siam and China in this list is a question only of a short time. The metric system is practically permissive in the United States (obligatory for the medical departments of the national government), in Greece, in the United Kingdom, in Russia (obligatory in military medicine), in Egypt (obligatory in public works and in government transactions), in Turkey, in Bolivia, and in Paraguay. The obligatory adoption of the metric system rejected in the United Kingdom by a vote in the House of Commons by a majority of 32 votes on March 22, 1907, will certainly be hastened by the vigorous movement in its favor in the British colonies. The British government has, in fact, instituted a royal commission charged with the study of measures designed to increase the commerce of the mother country with the colonies and with foreign countries. The question of the reform of weights and measures is one of the first on the programme of the commission. Parallel to this reform, the application of the metric system has been adopted in certain international branches of commerce. For example, the trade in precious stones, in which the carat, differing in the respective countries, was nowhere a simple sub-multiple of the gram. (See INTERNATIONAL METRIC CARAT.) Besides these accessions to the principles of the system, it is interesting to note a marked tendency toward extending the principle of legal uniformity to other measures than those of space and quantity of material to which it had hitherto been limited. Dynamic and thermal quantities, such as energy in all its forms, have become the subjects of constant change and their use demands their own special measures just as in the case of those quantities whose units have been for a long time defined in the laws. For the expression of these units the C. G. S. system, whose fundamental units have been loaned to the metric system, gives a code of measures universally adopted in the sciences and from which the electrical industries have equally profited. A more complete elaboration of the rational systems of measures beginning with the fundamental units of the meter or kilogram and the second, is about to be carried out. It attracts the close attention of scientists and technicians, and equally concerns the law-makers. The Hungarian law of January 10, 1907, gives a large place to the rational units for the measure of energy. The Bulgarian law of April 10 has sanctioned a similar measure of progress and the definite form under which definitions must be given is laid down in the laws that are in preparation in Argentina and France. The application of rational principles led to the joule and the watt as units for energy and power. The employment of these units by electricians in all countries will shortly result in imposing them upon all the industries. This will be a new and important conquest for the metric system.

WEIHAIWEI. The territory leased by China to Great Britain, situated on the north-east coast of the Shantung Peninsula and composed of the island of Liukung, all the islands in Weihaiwei Bay, and a strip of mainland ten miles wide along the entire coast line. Total area, 285 square miles; population (census of 1911), 147,177. Port Edward is the chief port and the residence of the commissioner (1912, Sir J. H. Stewart Lockhart).

WELFARE WORK. During the past few years there has been a very striking extension of the activities and expenditures of employers designed to better the health and increase the efficiency and contentment of their workers. This welfare work has taken a great variety of forms extending all the way from clean factory yards to old-age pension systems. One of the most active agencies in the promotion of welfare work is the National Civic Federation, which has a special department devoted to it. Among the features of such work promoted by this department are: More sanitary work places; recreation opportunities and facilities; educational advantages; rental or sale of houses to employees; and provident funds for loans to employees, sickness insurance, and other normal expenditures, as well as provision for old age. Thus the introduction of sanitary science into factory construction and management has resulted in better air and light, more healthful temperature, pure water, lavatory facilities, clean and cheery lunch rooms, rest rooms, and hospital rooms with attendant nurses for the injured or temporarily sick. Recreational and educational advantages have similarly been developed more or less elaborately, depending on the character of the industry and the enthusiasm of the employer. The construction of model towns or suburbs for employees has not been carried as far in this country as in England, but is becoming a conspicuous feature of the efforts to improve the conditions of workers. Those of recent construction embody the best ideas of city planning with provision for gardens, parks, playgrounds, gymnasium, and recreation centre, library, and civic centre. There are now numerous companies that have regularly employed welfare experts who organize and supervise the industrial betterment activities in all respects. One of the new features of such work is instruction of the workers in personal hygiene; especially is attention being given to the instruction of girl and women workers in the care of their bodies. So also there are instances of regular instruction in domestic science at the employer's expense in plants employing many young women. This looks forward to the time when many of them will be wives and mothers.

Many employers have enlisted in the campaign against the loan shark. There is scarcely an employer of labor some of whose employees do not find themselves unexpectedly in urgent need of money as a result of accident, sickness, surgical operation, funeral expenses, unemployment, and other common incidents. These have furnished the loan shark's opportunity and he has loaned at exorbitant rates and under hard conditions. Thus the money-lender fattened upon human misfortune. Welfare work to remedy this evil has taken the form of loans by employers at low rates of interest or even without interest; this is usually accompanied by a deposit system whereby the employer pays more than savings-bank interest on deposits of his own employees. This stimulates thrift and provides the worker with a fund of his own in case of any unexpected need. See **LOAN SHARKS.**

One of the most extensive plans of welfare work is that instituted by the United States Steel Corporation in the latter part of 1911. This is under the immediate supervision of Dr.

Thomas Darlington, formerly health commissioner of New York City. The estimated cost in 1912 was \$5,000,000. In the first place should be mentioned the comprehensive plans for accident prevention and compensation, for retirement pensions, and for profit-sharing. Thus the campaign for accident prevention cost over \$2,500,000 and now entails an annual cost of \$750,000; the plan of compensation for accidents, including hospitals, and medical, and surgical attendance, costs about \$2,000,000 annually; for old-age pensions there has been provided a permanent fund of \$12,000,000. More than 1600 employees have been retired on pensions varying from \$12 to \$100 per month at an annual cost to the corporation of \$700,000. The new departure has undertaken an extensive plan for sanitation and welfare costing in the first year \$1,250,000. Among these activities are: Perfected sewage disposal; pure water in plants and company houses; drainage, fly prevention; weed cutting and garbage collection; installation of wash rooms; shower baths and swimming pools; playgrounds for employees' children; and provision of lunch-rooms, waiting-rooms, better light, and ventilation. Not all of these have been undertaken by all the companies. The corporation has announced its belief that "following in the wake of betterment of conditions in the steel industry, there will naturally come a shortening of the hours of labor, which will tend toward increase of efficiency and resourcefulness in the working population." See UNITED STATES STEEL CORPORATION, paragraph *Labor Conditions*.

Many trade-union leaders continued to look with suspicion on the various kinds of welfare work, including old-age pension and accident compensation systems. Their fear is that by these means the workers will be so tied to their jobs that all effective means of bettering their conditions, as by strikes, will be made impossible, or at least extremely difficult. Mr. Louis D. Brandeis, speaking before the organized labor of Massachusetts in September, declared that these schemes "create a new form of peonage." Moreover, many workers prefer to get their betterments in the form of higher wages which they may then devote as they individually choose to higher standards of living. They strongly resent the element of tutelage involved in having social betterment plans handed down to them from higher authorities. Thus between merely enlightened selfishness on the employer's part and thankless acceptance on the laborer's part, welfare work does not seem destined to solve the labor problem.

WELLAND CANAL. See CANALS.

WELLESLEY COLLEGE. An institution for the higher education of women at Wellesley, Mass., founded in 1875. The total enrollment in the autumn of 1912 was 1424. The faculty numbered 173. The following promotions among the members of the faculty are important: Associate Professors Eva Chandler, mathematics, Margaret Pollock Sherwood, English literature, and Alice Robertson, zoology, were appointed professors in their respective departments. A number of instructors became associate professors, and several assistants became instructors. The most noteworthy benefaction received during the year was a scholarship of \$10,000. The productive funds at the end of the collegiate year 1912, amounted to \$940,814, and the income was \$59,969. The library

contained 73,100 volumes. Dean, Ellen F. Pendleton.

WELLS, ALMOND BROWN. An American soldier, died September 7, 1912. He was born in New York City in 1842. In 1863 he was appointed first lieutenant of the first battalion of Nevada Cavalry, and was promoted to be captain in the following year. He was honorably mustered out of service in 1865 and in 1866 was appointed second lieutenant of the 8th United States Cavalry. He rose through the different ranks of service until he became brigadier-general in 1903, and in the same year was retired from active service at his own request, after thirty years spent in the army. This included service in Cuba during the Spanish-American War, in China during the Boxer Rebellion, and in the Philippine Islands.

WELLS, H. G. See LITERATURE, ENGLISH AND AMERICAN.

WELSH DISESTABLISHMENT. See GREAT BRITAIN, *History*.

WENDELL, OLIVER CLINTON. An American astronomer, died November 8, 1912. He was born in Dover, N. H., in 1845, and graduated at Bates College in 1868. In the same year he became an assistant in the Harvard Observatory. For the ten years following 1869 he was a civil and hydraulic engineer. In the latter year he again became assistant in the Harvard Observatory, remaining in that position until 1898, when he was appointed assistant professor. During his term at the observatory he had charge of the reductions and calculations for the *Annals of the Observatory* and was also orbit calculator. He made upward of 1000 observations. He achieved distinction by his discoveries of several stars. He was a contributor to journals of astronomy.

WERNHER, Sir JULIUS. An English capitalist, died May 22, 1912. He was born in Darmstadt in the Grand Duchy of Hesse in 1850. His commercial career was begun in a banking house in Frankfurt, but early in 1870 he removed to London as a clerk in an Anglo-German firm. He returned to Germany at the outbreak of the Franco-German War and served throughout that conflict. After the war he engaged in business for a short time in Paris, but at the close of 1871 he went to South Africa, where the diamond fields had recently been discovered and the city of Kimberley had just been founded. His mission to South Africa was the purchase and exportation of diamonds. He remained in Kimberley for nearly ten years and laid the foundations of his great fortune. He became the South African representative of a great French diamond house and in 1880 was transferred to London as English partner in the firm of Porges and Wernher. In 1884 he returned to Kimberley and remained there for the year. During this visit he formed a connection with the late Alfred Beit, who became the Kimberley representative of the firm. Two years previously the firm of H. Eckstein and Co. had been founded at Johannesburg as a branch of the business of Porges and Wernher. This branch was formed as a result of the discoveries of gold in the Witwatersrand in 1886. From that date the fortunes of the firm began to increase greatly. In 1888 as a result of the amalgamation of the diamond mines of Kimberley by the late Cecil Rhodes and Alfred Beit, Wernher became the life governor of the De Beers corporation. Before the close of the

following year Mr. Porges retired from business and the firm assumed the name under which it became famous, Wernher, Beit, and Co. The partners in this firm formed a combination of extraordinary strength and amassed a great fortune. Besides playing a great part in the government of De Beers, Wernher was a director of the Rand Mines, and chairman of the Central Mining Investment Corporation. A few years before his death his name was before the public in connection with the prosecution of a Frenchman named Lemoine, who had obtained from him large sums of money on the pretense of having discovered a process for the manufacture of diamonds. Lemoine was subsequently sentenced to six years' imprisonment for fraud. Wernher was created a baronet in 1905. At the time of the South African War he, with his partner, provided the funds which enabled the citizens of Johannesburg to raise a volunteer regiment. He was much interested in education and in February, 1911, was awarded the gold medal of the Institute of Mining and Metallurgy in recognition of his services to the advancement of technological education. A short time before this he gave \$50,000 to the National Physical Laboratory for the extension of the metallurgical department. The greatest monument to his munificence, however, will be the new South African University, to which he and his partner, Alfred Beit, made large gifts. He was well known as an art collector and was conspicuous in philanthropic and social movements.

WESLEYAN METHODIST CONNECTION OF AMERICA. This denomination was founded in 1843 by members of the Methodist Episcopal Church who strongly opposed the institution of slavery. In 1912 there were 18,510 members or communicants, 613 ministers and 519 churches. The church property is valued at approximately \$650,000. Among the educational institutions maintained are Houghton Seminary at Houghton, N. Y., Miltonvale College at Miltonvale, Kan., and Central College at Central, S. C. The official journal of the denomination is the *Wesleyan Methodist*, published at Syracuse, N. Y. The highest authority is the quadrennial general conference. The last meeting of this body was held in October, 1911. The denomination carries on missions in Sierra Leone, West Africa, and in India.

WESLEYAN UNIVERSITY. An institution of higher education at Middletown, Conn., founded in 1831. The enrollment in all departments of the university in the autumn of 1912 was 405. The faculty numbered 40. Durant Drake, Ph. D., was appointed associate professor of ethics and religion. During the year an endowment fund of \$1,000,000 was completed largely through the efforts of the alumni of the university. The productive funds amounted on June 30, 1912, to \$1,814,150. The income from investments amounted to \$84,226, and from other sources, \$59,223. There were about 90,000 volumes in the library. President, William A. Shanklin, D. D.

WESTERN AUSTRALIA. A state of the Commonwealth of Australia. Area, 975,920 square miles. Population (census of April 3, 1911), 282,114, exclusive of full-blooded aborigines. Perth, the capital, had 35,767 inhabitants; with suburbs, 106,792. Governor in 1912, Sir Gerald Strickland, who was appointed to be governor of New South Wales in 1913,

when Maj.-Gen. Sir Harry Barron, the governor of Tasmania, would succeed him as governor of Western Australia. Premier in 1912, John Scadden. See AUSTRALIA.

WESTERN PHILOSOPHIC SOCIETY. See PHILOSOPHIC SOCIETY, WESTERN.

WESTERN RESERVE UNIVERSITY. An institution for higher education at Cleveland, O., founded in 1826. The number of students enrolled in the various departments of the university in the autumn of 1912 was 1380. The faculty numbered 242. There were no noteworthy changes in the faculty during the year. During the year a special endowment fund of \$1,000,000 for the medical department of the university was completed. The productive funds amounted to about \$3,500,000, and the income to about \$170,000 annually. The library contained about 100,000 volumes. President, Charles F. Thwing, D. D.

WEST INDIAN HURRICANES. See METEOROLOGY.

WEST VIRGINIA. POPULATION. According to the Census Bureau statistics compiled during 1912 out of the total population of 1,221,119 in 1910, 57,072 were foreign-born whites, compared with 22,379 in 1900. Of these the largest number, 17,223, came from Italy; from Germany, 6316; from Austria, 8582; from Hungary, 5707; from Russia, 5142. Other European countries were represented by smaller numbers. The negroes in the State in 1910 numbered 64,173 and the mulattoes 20,879. In 1890 the negroes numbered 32,690 and the mulattoes 9354.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1912 are shown below:

		Acreage	Prod. Bu.	Value
Corn	1912	725,000	24,505,000	\$16,928,000
	1911	707,000	18,170,000	13,991,000
Wheat	1912	233,000	3,378,000	3,412,000
	1911	238,000	2,737,000	2,792,000
Oats	1912	111,000	3,108,000	1,461,000
	1911	110,000	2,420,000	1,355,000
Rye	1912	17,000	221,000	186,000
	1911	17,000	187,000	168,000
Potatoes	1912	47,000	5,264,000	3,264,000
	1911	44,000	1,980,000	2,059,000
Hay	1912	745,000	a 1,028,000	15,420,000
	1911	648,000	a 428,000	8,560,000
Tobacco	1912	15,800	b 12,008,000	1,321,000
	1911	15,000	b 11,250,000	900,000

a Tons. b Pounds.

MINERAL PRODUCTION. The total production of petroleum in the State in 1911 was 9,795,464 barrels, compared with a production of 11,753,071 barrels in 1910. The product of 1910 was the largest ever obtained in the State. Several important oil fields were discovered during the year. There were 1191 wells completed in the State in 1911.

The production of coal in West Virginia in 1911 was 59,831,580 short tons, valued at \$53,670,515. Since 1909 the State has ranked second in the coal-producing States. It stands alone in the low average price which its coal, some of it the highest grade bituminous, brings to the producer. In 1911 the average price per ton was 90 cents. The production in 1911 showed a decrease from that of 1910 by 1,839,439 tons. The production of 1910, however, was above the normal on account of strikes in other coal-mining regions. The number of men em-

played in the coal mines of the State in 1911 was 66,350.

The value of the brick and tile, pottery, and other clay products in 1911 was \$4,333,420, an increase of \$335,375, compared with the figures for 1910.

MANUFACTURES. The Thirteenth Census statistics are for the calendar year 1909 and were compiled in 1912. While West Virginia is more a mining than a manufacturing State, it is especially well adapted to the development of manufactures on account of the vast deposits of coal, the abundance of petroleum and natural gas, abundant timber, and gasoline, and water-power facilities. It will be seen from the following table that the number of manufacturing establishments in 1909 was 2586, which gave employment to 71,463 persons.

	Number or Amount 1909	1904	P. C. of Inc. 1904-'09
Number of establishments	2,586	2,109	22.6
Persons engaged in manufactures ..	71,463	48,880	46.2
Proprietors and firm members...	2,599	2,230	16.5
Salaried employees.	4,971	2,892	71.9
Wage earners (average number)...	63,893	43,758	46.0
Primary horsepower	217,496	138,578	56.9
Capital	\$150,923,000	\$86,821,000	73.8
Expenses	144,666,000	86,738,000	66.8
Services	38,710,000	24,052,000	60.9
Salaries	5,710,000	2,899,000	97.0
Wages	33,000,000	21,153,000	56.0
Materials	92,878,000	54,419,000	70.7
Miscellaneous	13,078,000	8,267,000	58.2
Value of products..	161,950,000	99,041,000	63.5
Value of products less cost of materials	69,072,000	44,622,000	54.8

The largest value of product was in industries connected with lumber and timber, \$28,758,000; iron and steel products were valued at \$22,435,000; leather products, \$12,451,000; glass, \$7,779,000; flour and gristmill products, \$7,696,000. The total number of persons employed in manufactures in the State in 1909 was 71,463, of whom 66,121 were male and 5342 female. The number of persons employed under 16 years of age was 1053. The prevailing hours of labor for 49.3 per cent. of the wage earners were 60 a week; only 16.2 per cent. of the total working in establishments where the prevailing hours were less than 54 a week, and 12.9 per cent. in those where they were more than 60 a week. The largest number of wage-earners was in Wheeling, 7809; in Huntington, 3156; in Parkersburg, 1495; and in Martinsburg, 1420.

FINANCE. The receipts for the fiscal year 1912 from the State fund amounted to \$4,625,212, and from the general school fund to \$797,186. The expenditures for the fiscal year amounted to \$4,486,307, leaving a balance in the treasury at the end of the fiscal year of \$1,616,515, to which should be added the invested portion of the irreducible school fund, \$973,200, making a total balance of \$2,589,715. The chief expenditures were for education, for the maintenance of charitable and correctional institutions, and for the salaries of State officers. There is no State debt.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State, with their populations on September 30, 1912, were as follows: West Virginia Hospital for the Insane, 1002; Second Hospital for the Insane, 500; West Virginia Asylum, 535; Miners' Hospital No. 1, 72; Miners' Hospital, No. 2, 24; Miners' Hospital, No. 3, 24; West Virginia Penitentiary, 1128; West Virginia Reform School, 285; West Virginia Industrial Home for Girls, 77; West Virginia School for the Deaf and Blind, 184; West Virginia Colored Orphans' Home and Industrial School, 78; Children's Home, 52. The Colored Orphans' Home and Industrial School and the West Virginia Children's Home are institutions which have been recently established by the State legislature. The legislature also established a State tuberculosis sanitarium, which was ready for patients on December 1, 1912.

POLITICS AND GOVERNMENT

The legislature did not meet in 1912, as the sessions are biennial and the last was held in 1911. The next session convenes January 9, 1913. Elections for governor and other State officers were held on November 5.

On May 16 the Republican State convention instructed sixteen of the State delegates to vote for Roosevelt at the national convention. The Democratic delegates were instructed to vote for Champ Clark. The Republican State primary for the nomination of State officers nominated Henry D. Hatfield for governor. The Democrats nominated William R. Thompson. The Progressive party had no candidates for State officers in the field. This party held its first convention on July 30 and chose delegates to the National Progressive convention. The election on November 5 resulted as follows: Wilson 113,048, Roosevelt 78,819, Taft 56,667, Debs 15,346, and Chafin 4534. Wilson's plurality was 34,227. For governor, Hatfield, Republican, received 127,942 votes, Thompson, Democrat, 119,173, Hilton, Socialist, 14,900, and Jackson, Prohibition, 5816.

STATE GOVERNMENT. Governor, H. D. Hatfield; Secretary of State, Stuart F. Reed; Superintendent of Free Schools, M. P. Shawkey; Auditor, John S. Darst; Commissioner of Agriculture, Howard E. Williams; Attorney-General, A. A. Lilly; Treasurer, E. L. Long; Adjutant-General, Charles D. Elliott; Secretary State Board of Agriculture, J. M. Millan—all Republicans.

JUDICIARY. Supreme Court of Appeals—President, L. Judson Williams; Associate Justices, George Poffenbarger, Ira E. Robinson, Charles W. Lynch, Henry Miller; Clerk, W. B. Mathews—all Republicans.

STATE LEGISLATURE, 1913. Senate, Democrats 16, Republicans 14; House, Democrats 33, Republicans 53; joint ballot, Democrats 49, Republicans 67. Democratic majority in Senate 2. Republican majority in House 20; on joint ballot 18.

The representatives in Congress will be found in the article UNITED STATES, section Congress.

WEST VIRGINIA UNIVERSITY. A State institution for higher education at Morgantown, W. Va., founded in 1867. The enrollment in the colleges of the university in the autumn of 1912 was 476, and in the various schools 103. The faculty numbered 65. Several new members of the faculty were appointed during the year. These include Prof. George F. Wells, who succeeded Professor Willey of the law department, who retired after twenty-four

years of service. Prof. R. E. Hunt was appointed to the head of the department of animal husbandry in the department of agriculture. Dr. J. E. Hodgson was appointed associate professor of mathematics, and Prof. Alexander P. Moore was appointed assistant professor of French. An important change in the college administration was the division of the school year into semesters, instead of three terms as formerly. There were no noteworthy benefactions received during the year. The library contained about 46,000 volumes. President, Thomas E. Hodges.

WHARTON, EDITH. See LITERATURE, ENGLISH AND AMERICAN.

WHEAT. The world's wheat crop of 1912 was not uniformly good, but was somewhat irregular as a result of unfavorable climatic conditions. In nearly all European countries the crop suffered from a cool and backward season and later from rainy and cloudy weather during harvest. Yield and quality were both reduced by these conditions, the reductions in yield being large enough to increase perceptibly the requirements of most wheat-importing countries. In Italy the wheat yield was reduced by a long and serious drought during the growing season. Drought also menaced the wheat crop of Russia early in the season, but timely rains more than offset the injury and the production was about normal and nearly 50 per cent. greater than the yield of 1911, a year of extreme shortage. In the southern hemisphere the crop harvested late in 1911 and early in 1912 was satisfactory in Argentina, but short in Australia, being about 25 per cent. less than the previous yield. The import requirements of all countries were estimated at 622,400,000 bushels in 1912, as compared with 530,400,000 bushels in 1911. The greatest increase in import requirements was recorded for the United Kingdom, the quantity being 25,600,000 bushels, or about one-eighth of the total imports the year before. Germany's requirements were 80,000,000 bushels and Italy's 60,000,000 bushels, as against 57,600,000 and 40,000,000 bushels respectively in 1911. The import requirements of the world supplied by the export countries were distributed as follows: Russia, 136,000,000 bushels; Canada, 112,000,000 bushels; United States, 96,000,000 bushels; Balkan States, 56,000,000 bushels; India, 48,000,000 bushels; and Argentina, Australia, and Chile together, 176,000,000 bushels. In the United States, climatic conditions were unfavorable to the winter wheat crop through the fall and winter, and the acreage of wheat winter-killed has probably never been greater. The fall of 1911 was very dry; the following winter was of unusual severity, and the spring exceptionally late. After the opening of spring, however, the season was most favorable and the excellent growth of the crop largely overcame the losses due to the extensive winter-killing of the fall-sown grain.

The principal wheat-producing countries of the world in 1912 and their yields were as follows: United States, 730,627,000 bushels; Russia, 727,011,000 bushels; British India, 366,370,000 bushels; France, 334,871,000 bushels; and Canada, 205,685,000 bushels. According to statistics furnished by the Department of Agriculture, the United States produced 399,919,000 bushels of winter wheat from 26,571,000 acres, this production being about 30,000-

000 bushels less than in 1911, when the area was greater by 2,591,000 acres. This reduction in acreage was to a large extent the result of the severe winter. The spring wheat yield amounted to 330,348,000 bushels from an area of 19,243,000 acres, as compared with 190,682,000 bushels and 20,381,000 acres in 1911. The farm value per bushel on December 1, 1912, was 76 cents, the average price for spring and winter wheat, while a year before it was 87.4 cents, and two years before 88.3 cents. The total value of the crop in 1912 was \$555,280,000, or only \$12,217,000 greater than in 1911, when the total production was about 109,000,000 bushels less. This value was exceeded only by the value of the crops of 1908, 1909, 1910. The farm value of winter wheat December 1, 1912, was 80.9 cents, and that of spring wheat 70.1 cents per bushel.

The leading winter wheat States in 1912 were: Kansas, producing 91,450,000 bushels; Nebraska, 50,850,000 bushels; Washington, 27,269,000 bushels; Missouri, 23,750,000 bushels; Pennsylvania, 22,320,000 bushels; and Oklahoma 20,096,000 bushels. In 1911 the leading States in decreasing order of production were: Kansas, Illinois, Nebraska, Ohio, Missouri, and Indiana; and the range in yield was from 51,030,000 to 34,354,000 bushels. The average yield of winter wheat was 15.1 bushels per acre as against 14.8 bushels in 1911. Among the leading States Washington ranked first, with an average yield of 27.6 bushels per acre, while Oklahoma produced only 12.8 bushels. Spring wheat in 1912 was produced in 19 States, of which 15 also produced winter wheat. The leading States and their yields were as follows: North Dakota, 143,820,000 bushels; Minnesota, 67,038,000 bushels; South Dakota, 52,185,000 bushels; and Washington, 26,459,000 bushels. In all other States the production was under 8,000,000 bushels. The average acre-yield of spring wheat for the United States in 1912 was 17.2, as compared with 9.4 bushels in 1911. Among the leading spring wheat States Washington ranked first, with an average acre-yield of 20.4 bushels. The durum wheat production of the country was estimated at over 40,000,000 bushels, of which North Dakota produced 17,884,000 bushels; South Dakota, 14,343,000 bushels; and Minnesota, 2,334,000 bushels.

On March 1, 1912, about 122,025,000 bushels of wheat were in farmers' hands, or 19.6 per cent. of the crop of 1911, as compared with 162,705,000 bushels, or 25.6 per cent. of the crop of 1910 on March 1, 1911. The wheat exports of 1912 exceeded those of recent years, the quantities sent abroad being mainly from the crop of the year and shipped to offset European shortage in the cereal.

WHEELER, CHARLES GILBERT. An American chemist and mining geologist, died February, 1912. He was born in London, Canada, and graduated from Harvard College in 1858. He studied in foreign universities and in 1886 was appointed professor of chemistry in the University of Chicago. In 1869 he invented the Babcock chemical fire extinguisher. He acted as geologist and interpreter on the commission to examine the route of the Nicaragua canal in 1899.

WHEELWRIGHT, EDMUND MARCH. An American architect, died August 16, 1912. He was born in Roxbury, Mass., in 1854, and grad-

uated from Harvard College in 1876. He studied architecture at the Massachusetts Institute of Technology and later in Europe. On his return to the United States he was employed in the offices of Peabody and Sterns in Boston, and in firms in New York and Albany. In 1883 he started a business of his own and afterwards became a member of the firm of Wheelwright and Haven, and later, Wheelwright, Haven, and Hoyt. He was city architect of Boston from 1891 to 1895. He with R. Clipston Sturgis designed the new Museum of Fine Arts in Boston. He also designed Jordan Hall and the Boston Opera House. He was chief designer of the Cambridge Bridge in 1900. Other works include the Cleveland Museum of Art and the Massachusetts General Hospital. He was the designer of the new Hartford bridge, which cost \$2,000,000.

WHISKY. See LIQUORS.

WHITE, Sir GEORGE STUART. An English field marshal, died June 24, 1912. He was born in White Hall, County Antrim, Ireland, in 1835. He enlisted in the army at the age of 18. In 1863 he was made captain and in 1873 major. He became lieutenant-colonel of the Gordon Highlanders and military secretary to the Viceroy of India in 1881. Four years later he participated in the expedition to the Nile. He reached the rank of colonel in 1885, and lieutenant-general in 1895. From 1893 to 1898 he was commander-in-chief of the forces in India. He took a prominent part in the Boer War and conducted the notable defense of Ladysmith, which made his name famous throughout the world. He twice won the Victoria Cross, first in 1879 for conspicuous bravery in the action against the Afghans, and in 1880 in an action also against the Afghans. He took part in Lord Roberts' famous march to Candahar.

WHITE, TRUEMAN CLARK. An American jurist, died February 7, 1912. He was born at Perrysburg, N. Y., in 1840, and was educated at the Springville Academy. He enlisted as a private on the first call for troops in the Civil War and served throughout the conflict, rising to the rank of first lieutenant. After the war he practiced law in Buffalo and became judge of the superior court of that city. He was later appointed judge of the supreme court of the State. His term expired December 31, 1910. Judge White presided at the trial of Leon Czolgosz, who assassinated President McKinley.

WHITE MOUNTAINS. See FORESTRY.

WICKLIFFE, ROBERT C. Representative in Congress from Louisiana, died as the result of accident, June 11, 1912. He was born at Bardstown, Ky., in 1874, and was educated in the public schools of St. Francisville, La., and at Centre College, Ky., graduating from the latter institution in 1895. He studied law at Tulane University, taking a degree in 1887. He then began the practice of law at St. Francisville in 1893. He was a member of the constitutional convention which framed the present constitution of Louisiana. He served throughout the Spanish-American War, and after this resumed the practice of his profession. In 1900 he was elected district-attorney of the 24th judicial district of the State. In 1908 he was a candidate in the Democratic primaries for the nomination to Congress from the 6th district and

received the nomination. He was elected to the Sixty-first Congress and reelected to the Sixty-second.

WIDOWS' PENSIONS. See WELFARE WORK.

WIDOWS' PENSIONS. The frequent objection to child labor legislation, that it inflicts hardship upon widows of the working class who have children thrown out of employment thereby, has finally resulted in widows' pensions as a means of meeting this undoubtedly difficult situation. A number of cities in recent years have established scholarship funds from which children of poor widows affected by advanced child labor laws have been paid small weekly sums in lieu of possible earnings. The children have thus been enabled to attend school and the economic status of the family has remained unchanged. Beginning in 1911 five States have now determined to handle this problem by governmental action. Illinois, Michigan, Missouri, Ohio, and Oklahoma in 1911 made legal provisions whereby the courts or other public authority should pay regular sums to any widowed mother of good character who needs aid. In some cases relief is granted through the school authorities; in some cases it is in the form of textbooks, clothing, and meals, and in others in the form of money. This plan is actively advocated by the National Probation League and the Widowed Mothers' Fund Association of New York. It has been approved by the New York City Commission on Congestion of Population, adopted by the juvenile courts of Chicago and Milwaukee, and was being investigated in 1912 by commissions in Massachusetts and Ohio. One form of solving the problem is the boarding of dependent children with their mothers instead of caring for them in public institutions or in other homes. The courts of California have authorized the "boarding out" of children with their own parents. Similarly the Cook County Juvenile Court had in the summer of 1912 provided for the care of 327 mothers with 1200 children. The cost per child was \$5.65 per month, as compared with about \$10 under the older plans of institutional care or boarding in homes of strangers. The city of Indianapolis has even gone to the length of building a number of small cement houses which are let, rent free, to working women with children. A free nursery and kindergarten are also provided. The argument is made that it is better for the community that the mother devote her time to the rearing of her children in normal circumstances than that she neglect them in order to earn a small wage for her support. It is pointed out that statistics of the Elmira Reformatory show that 60 per cent. of the inmates were brought up in institutions. Consequently the additional cost to the State is expected to be offset by a decrease in expenditures for criminal prosecutions. Moreover, there will be a lessening of criminal and other pathological social conditions. Since it is clear that a mother cannot both work and at the same time give her children the full services of motherhood, and since the mother may be expected to care more conscientiously for her offspring than strangers, it is believed to be wholly justifiable for the State to assume the responsibility of moderate support. In Massachusetts a committee of the legislature was appointed to investigate the subject and recommend legislation to the 1913 session.

WILLIAM MARSH RICE INSTITUTE, now **RICE INSTITUTE.** An institution of liberal and technical learning, incorporated in 1891, in Houston, Tex., as the William M. Rice Institute for the Advancement of Literature, Science, and Art. Its founder was William Marsh Rice, a resident of Houston, who had amassed a large fortune. In accordance with the wish of Mr. Rice, the elaboration of plans for the development of the institute were postponed until after his death. This occurred in 1901 under circumstances which led to the charge of murder against Albert J. Patrick (see **NEW YORK**) and which involved the estate in long years of litigation. When the trustees came into possession of the foundation, which then amounted to about \$10,000,000, they invited Dr. Edgar Odell Lovett of Princeton University to assist them in formulating and executing the educational programme of the institute and elected him its president. Dr. Lovett undertook a year's journey of study which extended from England to Japan, and on the completion of this investigation, a site of 300 acres was secured at Houston, and the task of designing a general architectural plan consistent with the programme which had been adopted for the institute was undertaken.

In 1911, on the seventy-fifth anniversary of Texan independence, the corner stone of the administration building was laid by the trustees. This building, together with the first wing of the engineering quadrangle, the mechanical laboratory, and power house, and the first residential hall for men, neared completion at the end of 1912. The initial building schedule includes also special laboratories for instruction and investigation in physics, chemistry, and biology, and in the application of these sciences to the arts of industry and commerce.

The academic work of the institute began on September 23, 1912, and on October 10, 11, and 12 imposing ceremonies of inauguration accompanied the formal opening. Distinguished scholars and scientists from America and foreign universities participated in the proceedings. Among these were Prof. Rafael Altamira y Crevea, of Madrid, Spain, Prof. Emile Borel of Paris, France, Prof. Hugo de Vries, of Amsterdam, Holland, Prof. Sir Henry Jones of Glasgow, Scotland, Baron Dairoku Kikuchi, formerly Japanese minister of education, Prof. Wilhelm Ostwald, formerly professor of chemistry in the University College, London. All these scholars read or presented inaugural lectures, and a poem was read by Dr. Henry Van Dyke. The visiting scholars were welcomed by the governor of Texas, the mayor of Houston, and the board of trustees of the institute.

Tuition and matriculation at the institute are free. The endowment of the institute, approximately \$10,000,000, makes it seventh in rank in amount of endowment among American universities.

The initial staff of the institute was organized in 1912 in the faculty of science and the faculty of letters. At the end of the year the following members of the faculty of science had been chosen: Prof. Percy John Daniell, research associate in applied mathematics; William Franklin Edwards, formerly president of the University of Washington, lecturer in chemistry; Griffith Conrad Evans, Ph. D., assistant professor of pure mathematics; Julian Sorell Huxley, formerly of Oxford University, research

associate in biology; Francis Ellis Johnson, instructor in electrical engineering; Edgar Odell Lovett, Ph. D., formerly professor of mathematics in Princeton University and later head of the department of astronomy, professor of mathematics; William Ward Watkins, D. Sc., instructor in architectural engineering; Harold Albert Wilson, formerly of McGill University, professor of physics. The faculty of letters had not been established at the end of the year. The subjects of instruction which will first be established are mathematics, physics, chemistry, biology, engineering, architecture, ancient languages, modern languages, history and politics, philosophy and psychology, economics and sociology, and art and archaeology.

WILLIAMS COLLEGE. An institution of higher education at Williamstown, Mass., founded in 1793. The total enrollment in the college in the autumn of 1912 was 517. The faculty numbered 56. There were several important changes in the faculty during the year. These included the resignations of Assistant Professor James Percival King of the German department, who became professor of German at the University of Rochester, and Assistant Professor Clyde Shepherd Atchison to become professor of mathematics at Washington and Jefferson College. The following were added to the staff of instruction: Prof. Robert Longley Taylor, assistant professor of Romance languages at Dartmouth College, to be professor of Romance languages in place of Prof. Karl Ephraim Weston, who was transferred to the chair of the history of art and civilization. Prof. P. G. Wright was appointed instructor of economics during the absence of Assistant Professor David Taggart Clark. Several additional instructors were appointed in other departments. The total productive funds of the college on March 31, 1912, amounted to \$3,183,468 and the annual income is about \$225,000. The library contained about 75,000 volumes. President, Harry A. Garfield, LL. D.

WILSON, ANDREW. An English journalist and lecturer, died September 25, 1912. He was born in Edinburgh in 1852, and was educated at Edinburgh University and Medical School. In 1876 he was appointed lecturer on zoölogy and comparative anatomy at the Edinburgh Medical School and was for several years editor of *Health* and examiner on the faculty of medicine at the University of Wisconsin. Among his publications are: *Studies in Life and Sense*; *Leisure Time Studies*; *Chapters on Evolution*; *Leaves from a Naturalist's Notebook*; *Brain and Nerve*; and *The Modern Physician*. He was also an extensive contributor to magazine literature and contributed "Science Jottings" to the *Illustrated London News*.

WILSON, BUTLER H. See **BAR ASSOCIATION, AMERICAN.**

WILSON, JOHN L. An American newspaper proprietor and former United States Senator from Washington, died November 6, 1912. He was born in Crawfordsville, Ind., in 1850, and graduated from Wabash College in 1874. In 1880 he was elected a member of the Indiana House of Representatives. He removed to Washington and in 1882 was appointed receiver of public moneys at Spokane Falls, Wash., remaining in this position until 1886. In 1889 he was elected to the Fifty-first Congress and was reelected to the Fifty-second and Fifty-third Congresses. He resigned from the latter

in 1895. In February of the same year he was appointed United States Senator to fill the unexpired term of John B. Allen, Republican. He was the first member of Congress from the new State of Washington. Previous to his election to the House of Representatives he had served as delegate to Congress from the then Territory of Washington. He was proprietor of the *Seattle Post Intelligencer* of Seattle, Wash.

WILSON, (THOMAS) WOODROW. Elected President of the United States November 6, 1912. He was born in Staunton, Va., on December 28, 1856, of Scotch-Irish stock. His paternal grandfather, James Wilson, came to the United States from Ireland about 105 years ago, and settled in Philadelphia, where he engaged in the newspaper business with William Duane. He married Anne Adams, an Irish girl, who came over on the same ship. James Wilson did not remain long in Philadelphia, but afterwards established papers in several other cities of Pennsylvania. He died during the cholera epidemic of 1857, leaving four sons. The youngest son, Joseph Ruggles Wilson, father of Woodrow Wilson, was born in 1822. He learned the printing trade, but his inclinations were for the church. After studying at Washington and Jefferson College and at the Western Theological Seminary and Princeton Theological Seminary, he was ordained to the Presbyterian ministry. In 1849 he married Janet Woodrow, whose forebears were Scotch ministers and Covenanters. Joseph Ruggles Wilson became a professor in rhetoric in Jefferson College immediately after his marriage, and afterwards served as professor of chemistry in Hampden-Sidney College. He was called to a pastorate in Staunton in 1855, and there his son, Woodrow Wilson, was born. His parents removed to Augusta, Ga., in 1858, and thereafter, until he left to attend Princeton College, his home was in the South. His early education was received in Augusta, Ga. In 1870 the family removed to Columbia, S. C., where the father had been appointed professor in the Southern Presbyterian Theological Seminary. Woodrow Wilson was sent to Davidson College, at Davidson, N. C., where he remained for only one year when, on account of illness, he was obliged to return home. In the following year, 1875, he entered Princeton College, graduating in the class of 1879. Among his classmates were Mahlon Pitney, now a justice of the supreme court, Dr. A. S. Halsey, secretary of the Presbyterian board of foreign missions, Robert Bridges, an editor of *Scribner's Magazine*, and several other persons who afterwards became notable.

His career as a scholar at Princeton was not especially brilliant. His standing at graduation was forty-first in a class of 122. He was, however, prominent in other phases of inter-collegiate life. He was editor of the *Princetonian*, an active member of the American Whig Debating Society, and also organized a debating society among his friends. His interest in public life and the study of government was strong even in those early days, and it was said that at that time he made a resolution to support himself as a publicist. After his graduation he went to the Law School of the University of Virginia, where he remained until January 1, 1881. While he was at the law school he was awarded the medal in oratory given by the Thomas Jefferson Literary Soci-

ety. He was obliged to cut short his law studies on account of illness and returned to his home, which was then at Wilmington, N. C. In 1882 he was admitted to the bar and entered into partnership with E. I. Renick at Atlanta, Ga. He soon found that the active practice of law was not attractive and he began the writing of *Congressional Government*, the success of which later decided him against law as a profession.

In 1883 he decided to return to his studies and entered Johns Hopkins University for a post-graduate course in the science of government. He received the degree of Ph. D. from Johns Hopkins in recognition of his thesis on *Congressional Government*, which was published in 1885. It at once attracted wide attention and became the standard textbook in many high schools and colleges. James Bryce in his *American Commonwealth* acknowledged his obligation to Woodrow Wilson. The publication of this work brought to its author calls to the chairs of several colleges, and he finally accepted the position of associate professor of history and political economy at Bryn Mawr College in 1885. In the same year he married, at Savannah, Ellen Louise Axson, daughter of the Rev. S. Edward Axson.

In 1886 Dr. Wilson lectured at Johns Hopkins University and in 1888 was appointed professor of history and political economy at Wesleyan University. While serving in this chair he received the appointment of professor of jurisprudence and political economy at Princeton University where he entered upon his duties in 1890. He soon became one of the most popular members of the faculty. While at Wesleyan University his textbook, *The State*, had been published. This book has the distinction of serving as the accredited textbook in more than one hundred universities, including Oxford University. During his professorship at Princeton he published, *Division and Reunion, An Old Master and Other Political Essays, Mere Literature, and Life of Washington*. His most comprehensive work, *The History of the American People*, was published in 1902. In the same year he was unanimously elected president of Princeton University to succeed President Patton, who had resigned. He at once undertook measures of reform in the curriculum and administration of the university. His first work was to systematize four well defined courses leading to distinct degrees. He also brought about higher standards of admission and of routine scholarships. His most notable service at Princeton, however, was the establishment of a preceptorial system, which was at this time an innovation in the college administration. By this plan sixty-five new professors were added to the faculty and to each of them groups of students, numbering from two to five were assigned for personal supervision. These reforms were not made without opposition. His next attempt to bring about radical reform failed. This was the proposal to introduce the quadrangle system, and its purpose and effect would have been largely to abolish the upper class clubs, which are a distinctive feature of the social life at Princeton University. Dr. Wilson's plan was not to destroy these clubs, but to reorganize them on a basis of democracy where all students might enjoy their advantages. This he proposed to do by making the clubs a part of the univer-

sity. This plan when first presented to the board of trustees was adopted almost unanimously, but in the summer following the wealthy members of the university alumni clubs, who had been members of the exclusive upper class clubs, brought so much pressure to bear upon the university board that Dr. Wilson was requested to withdraw the quadrangle plan. These and other attempts to bring about more democratic conditions at Princeton won for him, to a certain extent, the hostility of the alumni of the university, especially the younger alumni.

During his administration at Princeton he had continued to write and lecture on political and social questions, and he became widely known throughout the country. As early as 1906 suggestions were made that he be a candidate for public office, but it was not until 1910, when conditions in New Jersey indicated the possibility of electing a Democratic governor, that serious thought was given to Dr. Wilson as a candidate for high office. James Smith, Jr., former United States Senator from New Jersey and the dominant figure in Democratic politics in the State, conceived the idea that Dr. Wilson would be an excellent candidate for governor. After a conference with other leading members of the Democratic party he was offered the nomination and accepted it. Conditions in New Jersey at that time were such as to call for severe and immediate reforms. The State was practically under the control of the large transportation companies which crossed it. After a stirring campaign in which Dr. Wilson took an active and prominent part, he was elected. He at once began to urge upon the legislature the necessity of passing measures leading to radical reforms. Before he had been governor for two weeks he came out for direct primaries, and it was largely through his influence that a law providing for them passed the legislature. He also brought about in a short time a direct primary for the selection of a successor to John Kean, United States Senator, and in that vote James E. Martine received the most votes among the Democratic candidates. This brought about a split between Governor Wilson and former Senator Smith, who himself had been a candidate for the nomination, but had received fewer votes than Mr. Martine. In spite of the efforts of Mr. Smith to annul the results of the direct primary vote, Governor Wilson remained firm and Martine was elected senator by the legislature.

Governor Wilson's administration was not popular with the political leaders of his party, but he soon obtained and held throughout office the support and approval of the people. His success as a Democratic governor in a normally Republican State made him early in 1911 a conspicuous candidate for the Democratic presidential nomination. He had, in fact, even before his election as governor, been frequently mentioned as a strong candidate, especially by Colonel George Harvey, editor of *Harper's Weekly* and the *North American Review*. While in his writings on American government he had taken rather a conservative point of view in his judgment of measures urged by the more radical wing of the Democratic party under W. J. Bryan—such measures as the initiative, referendum, and recall—during his term as governor he avowed his belief in these measures under the proper conditions. He thus made

himself acceptable not only to the conservative but to the progressive element of the party. The details of his campaign for the nomination and election will be found in the article **PRESIDENTIAL CAMPAIGN**.

During Governor Wilson's term in office in New Jersey there were passed, largely through his efforts, a direct primary law, a public utilities law, an employers' liability law, a corrupt practices act, a measure providing for the substitution of indeterminate sentences, the reorganization of the State school system, the abolition of contract labor in penal institutions, measures for the regulation of the age, employment, safety, health, and working hours of persons employed in mercantile establishments, a law extending the civil service to employees of the State, county, and municipalities, and an optional commission form of government act for cities, under what was originally known as the Galveston plan.

WINDWARD ISLANDS. The British West Indian colonies of St. Lucia, St. Vincent, and Grenada, together with the Grenadines, attached partly to Grenada and partly to St. Vincent. Each colony retains its separate institutions. See the articles under the separate titles. Sir James Hayes Sadler was governor and commander-in-chief in 1912, residing at St. George's, in Grenada. Geographically the Windward Islands include Barbados, Trinidad, and Tobago.

WINE. See **LIQUORS**.

WINES, FREDERICK HOWARD. An American statistician and penologist, died January 31, 1912. He was born in Philadelphia in 1838, and graduated from Washington College in 1857. He afterwards studied theology at the Princeton Theological Seminary, but was obliged to discontinue his course on account of weakness of the eyes. He was licensed by the presbytery of St. Louis in 1860. He served in the Civil War from 1862 to 1864 as chaplain in the Federal army. He afterwards returned to Princeton Theological Seminary, graduating in 1865. In the same year he was ordained to the Presbyterian ministry. From 1865 to 1869 he was pastor of the first church of Springfield, Mass. In the latter year he was appointed secretary of the Illinois State board of commissioners of public charities. He served in this position until 1893 and again from 1897 to 1899. In the latter year he was appointed assistant director of the United States Census. He held this office until 1902 and in the following year was appointed secretary of the New Jersey State Charities Aid Association, where he remained for one year. From 1909 until the time of his death he was statistical secretary of the Illinois State board of administration of public institutions. He was special lecturer on penological subjects at the Lowell Institute, Boston, and at Harvard, Charleston, Johns Hopkins, and other universities. In 1878 he was a member of the International Prison Conference and was president of the National Conference of Charities and Corrections in 1883. He served also as president of the National Prison Association. He was the author of *Defective, Dependent, and Delinquent Classes in the United States* (a volume of the Tenth Census); *Crime, Pauperism, and Benevolence* (a volume of the Eleventh Census); *Punishment and Reformation* (1895); *The Liquor Problem in Its Legislative Aspects* (1897-98).

WOODROW WILSON

ELECTED PRESIDENT OF THE UNITED STATES, 1912

Digitized by Google

He also published numerous pamphlets on charities and on penology.

WING, YUNG. A Chinese statesman and scholar, died April, 1912. He was born in China in 1828 and was one of the first of the group of Chinese youth sent to the United States for education. He graduated from Yale College in 1854. In 1872-4 he brought 120 Chinese youths to the United States to be educated. In 1898 when the empress dowager obtained control of the government he became allied with the reform party. Most of his time, however, was spent in the United States. He received the degree of LL. D. from Yale in 1876. In 1910 he edited a volume of *Reminiscences*.

WINKELMANN, HERMANN. A German dramatic tenor, died January, 1912. He was born in 1845 at Brunswick. He did not adopt the profession of singer until he had reached manhood. He began his career at Sondershausen and then went to Darmstadt and Hamburg. In 1882 he became identified with Wagnerian drama, taking the part of "Parsifal" at Bayreuth. He was so successful that he was engaged for the Imperial Opera at Vienna. Here he sang in Wagner's operas with Madame Materna and Herr Scaria. This trio made a tour of the United States in 1884.

WINNIPEG, MAN. See MUNICIPAL OWNER-SHIP.

WIRELESS TELEGRAPHY. See SAFETY AT SEA.

WIRELESS TELEGRAPHY AND TELEPHONY. Public interest in wireless communication was developed to an unprecedented degree as a result of the *Titanic* disaster. Federal regulations were established which enforce the installation of an efficient auxiliary transmitter and the carrying of two operators on passenger vessels, require all operators commercially engaged in interstate and foreign work to obtain a federal license, and forbid the establishment of radio stations within fifteen miles of certain important naval plants. The federal government has determined upon the erection of a chain of powerful stations connecting the new Arlington station with the Canal Zone and the Philippine Islands. The former is already complete and in use. It is said to have received clear transmission from Honolulu and to possess a sending radius of 3000 miles. Important developments in sending and receiving apparatus include a duplex arrangement whereby telegraphic messages may be sent and received at a station simultaneously. There has been marked progress in the direction of the use of the high-frequency alternator for sending purposes. Machines of small size have been developed for frequencies of 100,000 and 200,000 cycles, which considerably exceed the necessary limit for wireless use. It is predicted that suitable machines of a few hundreds of kilowatts will soon be available and will supplant the existing arc type of transmission, thereby greatly increasing the range and the independence of atmospheric conditions.

Announcement has been made of the successful use of the wireless detector in predicting the approach of storms by Professor Tourpain at his experimental post at La Rochelle, France.

An international conference on time agreed to the establishment of a central bureau at Paris, whence time is to be signaled officially from the Eiffel Tower station.

Experiments in wire-directed aerial telephony

made by its inventor, Major Squier, have demonstrated the practicability and importance of tuning the line to resonance at both the receiving and transmitting end, using the Audion detector and the high-resistance telephone receiver. The range of practicable frequencies extends from 10,000 to 100,000 cycles per second. A system of wireless telephony developed by Moretti and Vanni was tried successfully in Italy between Rome, Palermo, and other points over a range of about 250 miles with excellent communication. Bethenod announced that he has succeeded in increasing the length of the wave given off by the antennæ by combining a new system of induction coils with a new form of antennæ and a double-phase generator, all sparks and intermediary apparatus being suppressed. The arrangement facilitates to a marked degree the tuning of the receiver and transmitter. The inventor claims that his system brings wireless telephony close to a commercial basis and greatly extends its possible range of distance.

WISCONSIN. POPULATION. According to the Census Bureau statistics during 1912 out of a total population of 2,333,860 in 1910, 512,569 were foreign-born whites, compared with 515,705 in 1900. The largest proportion came from Germany, 233,018; from Norway, 56,948; from Austria, 38,862; from Russia, 29,786; from Sweden, 25,676; from Canada, 16,875; from Denmark, 16,454; from Ireland, 14,047; and from England, 13,959. Other European countries were represented by smaller proportions. In the city of Milwaukee, with a total population of 373,857, there were 111,456 foreign-born whites. Of these, 64,720 were from Germany. The negroes in the State in 1910 numbered 2900 and mulattoes 1143. In 1890 the negroes numbered 2444 and the mulattoes 1437.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1911 are shown in the table below:

		Acreage	Prod. Bu.	Value
Corn	1912	1,632,000	58,262,000	\$29,714,000
	1911	1,600,000	58,080,000	34,848,000
Wheat	1912	188,000	3,564,000	2,958,000
	1911	195,000	3,097,000	2,788,000
Oats	1912	2,272,000	84,746,000	27,119,000
	1911	2,250,000	67,050,000	30,172,000
Rye	1912	341,000	6,240,000	3,806,000
	1911	355,000	6,035,000	5,069,000
Potatoes	1912	291,000	34,920,000	11,873,000
	1911	280,000	28,600,000	10,108,000
Hay	1912	2,250,000	a 3,600,000	43,560,000
	1911	2,079,000	a 2,495,000	38,922,000
Tobacco	1912	42,200	b 54,438,000	5,988,000
	1911	41,000	51,250,000	5,125,000

a Tons. b Pounds.

MINERAL PRODUCTION. The production of iron ore in the State in 1911 amounted to 559,763 long tons valued at \$1,386,616, as compared with 1,149,551 long tons valued at \$3,610,349 in 1910.

The lead produced in the State in 1911 amounted to 3353 short tons valued at \$301,770, compared with 4413 short tons valued at \$388,344 in 1910. The zinc produced amounted to 28,774 tons valued at \$3,280,236, compared with 25,927 tons valued at \$2,800,116 in 1910.

MANUFACTURES. The Thirteenth Census statistics are for the calendar year 1909 and were compiled in 1912. While Wisconsin is largely an agricultural State, the advance in relative importance of its manufacturing industries has been marked. While in 1849 it ranked nine-

teenth among the States in manufactures, in 1909 it occupied eighth place. It will be seen from the following table that in 1909 there were 9721 manufacturing establishments, giving employment to 213,426 persons.

	Number or Amount 1909	1904	P. C. of Inc. 1904-'09
Number of establishments	9,721	8,568	13.6
Persons engaged in manufactures ..	213,426	173,572	23.0
Proprietors and firm members...	8,556	7,961	7.5
Salaried employees.	22,287	14,220	56.7
Wage earners (average number)...	182,583	151,391	20.6
Primary horsepower	554,179	440,234	25.9
Capital	\$605,657,000	\$412,647,000	46.8
Expenses	\$25,747,000	\$59,899,000	46.1
Services	119,642,000	86,970,000	37.6
Salaries	25,737,000	15,498,000	66.1
Wages	93,905,000	71,472,000	31.4
Materials	346,357,000	227,255,000	52.4
Miscellaneous	59,748,000	45,674,000	30.8
Value of products..	590,306,000	411,140,000	43.6
Value of products less cost of materials	243,949,000	183,885,000	32.7

The largest value of product was in the lumber and timber industries, \$57,969,000; foundry and machine shop products, \$54,124,000; butter, cheese, and condensed milk, \$53,843,000; leather, \$44,668,000; malt liquors, \$32,126,000. Other industries whose product was valued at more than \$10,000,000 were flour and gristmill products, slaughtering and meat-packing, paper and wood pulp, furniture and refrigerators, industries relating to railroads, boots and shoes, printing and publishing, automobiles, agricultural implements, and the manufactures of iron and steel. The total number of wage-earners in the State was 213,426, of whom 186,350 were male and 27,076 were female. The prevailing hours of labor for more than five-sixths of the wage-earners ranged from 54 to 60 a week; only 9 per cent. of the total being employed in establishments where they were less than 54 a week, and only 6.7 per cent. in those where they were more than 60 a week. The largest number of wage-earners was in Milwaukee, 59,502; in Racine were 8381; in Kenosha, 6449; in Oshkosh, 5778. The value of the manufacturing industries of Milwaukee was \$208,323,630.

FINANCE. The receipts for the fiscal year 1912 amounted to \$14,626,753, and the expenditures to \$13,985,248. The balance on hand at the end of the year was \$3,161,512. The chief sources of income were the railroad and corporation taxes and inheritance taxes. The chief expenditures were for educational purposes, charitable and penal institutions, for the State government, and for the new capitol. The State debt, which is the amount the State owes its trust funds at the end of the fiscal year, was \$2,251,000.

POLITICS AND GOVERNMENT

The legislature did not meet in 1912, as the sessions are biennial and the last was held in 1911. The next session convenes January 8, 1913.

There was much political interest in the State during the year, both on local and national issues. Senator La Follette up to the time of the Republican national convention, was an aggressive candidate for the Progressive nomina-

tion. (See **PRESIDENTIAL CAMPAIGN.**) He received strong support in his native State and in the presidential primary held on April 2 he carried the State by a large plurality of votes. He received 131,920 votes, and President Taft 47,630. Mr. Roosevelt did not appear as a candidate on the ballots in this election. At the national convention he contested the temporary chairmanship with Senator Root.

In accordance with the vote at the presidential primary the Wisconsin delegation was instructed to vote for Senator La Follette. In these primaries Governor Wilson received a majority of the votes for presidential candidate and the Democratic delegates were accordingly instructed to vote for him at the Democratic State convention. On September 3 Governor McGovern was renominated and Judge John C. Karel was chosen as the Democratic nominee. The Progressive party had no candidate in the field for State offices. The result of the election on November 5 was as follows: Wilson 164,228, Taft 130,895, Roosevelt 62,460, Debs 33,481, Chafin 8526, and Reimer 522. Governor Wilson's plurality was 33,533. For governor, McGovern, Republican, received 179,360; Karel, Democrat, 167,316; Thompson, Socialist Democrat, 34,468; Hill, Prohibition, 9433; Curtis, Socialist Labor, 3253.

OTHER EVENTS. A sub-committee of the Senate committee on privileges and elections, appointed in 1911 to inquire into the charges of corruption in the election of Senator Stephenson, agreed on January 18 upon a report in which it was held that the charges of bribery and corruption had not been proved. On February 10 the full committee ordered, by a vote of 8 to 5, a report exonerating Senator Stephenson. Five members of the committee, three Republicans and two Democrats, signed the majority report holding that the admitted expenditure of \$107,000 to obtain the nomination raised a presumption of guilt which had not been removed by the evidence. On March 26 the Senate by a vote of 29 to 27, refused to declare Senator Stephenson's seat vacant, and on the following day by a vote of 40 to 34 it declared that the charges against him had not been proved and that he was entitled to the seat. The vote for Stephenson was 28 Republicans and 12 Democrats, while against him were 18 Democrats and 16 Republicans.

Municipal elections were held in Milwaukee on April 2. These resulted in the defeat of the Socialist candidate for mayor, Emil Seidel, who had been mayor for two years. Mr. Seidel was defeated by Dr. G. A. Bading, candidate of the combined Republican and Democratic parties. Dr. Bading's majority was about 13,000. Over 80,000 votes were cast, as against 60,000 in the previous municipal election.

The income tax law enacted by the legislature of 1911 was held constitutional by the Supreme Court of the State on January 9.

The measure for the control of water power was declared unconstitutional January 31.

STATE GOVERNMENT. Governor, F. C. McGovern; Lieutenant-Governor, Thomas Morris; Secretary of State, John S. Donald; Treasurer, Henry Johnson; Attorney-General, W. C. Owen; Superintendent of Education, C. P. Cary; Commissioner of Insurance, H. L. E. Kern; Commissioners of Public Lands, Secretary of State, Attorney-General, and State Treasurer—all Republicans.

JUDICIARY. Supreme Court—Chief Justice, John B. Winslow, Democrat; Associate Justices, William H. Timlin, Democrat; R. G. Siebecker, Democrat; A. J. Vinje, Republican; Rouje D. Marshall, Republican; J. C. Kerwin, Republican; John Barnes, Democrat; Clerk, Clarence Kellogg, Republican.

STATE LEGISLATURE, 1913. Senate, Democrats 6, Republicans 23, Socialist 1, Nonpartisans 3; House, Democrats 24, Republicans 57, Socialists 6, Nonpartisans 13; joint ballot, Democrats 30, Republicans 80, Socialists 7, Nonpartisans 16. Republican majority, Senate 13, House 14, joint ballot 27.

The representatives in Congress will be found in the article UNITED STATES, section Congress.

WISCONSIN, UNIVERSITY OF. A State institution for higher education at Madison, Wis., founded in 1848. The total enrollment in the autumn of 1912 was 4014, which does not include the summer session for 1912 or the total for the short courses which begin December 1. The division among the departments of the university was as follows: College of letters and science, 2329; school of music, 60; college of engineering, 655; law school, 160; college of agriculture, 802; medical school, 65; Wisconsin library school, 36. The faculty numbered 595. During the year Prof. Eugene Kühnemann of Breslau, Germany, was appointed the first Carl Schurz memorial professor; Prof. Heinrich Keidel was appointed Prussian exchange professor, and Thomas Wood Stevens was appointed lecturer in art. The art department was newly created in 1912. The university is supported chiefly by the State. Its productive funds amounted at the end of the year 1912 to \$665,885, and the income from the productive funds to \$31,134. The library contains 185,079 bound volumes and about 60,000 pamphlets. President, Charles R. Van Hise, Ph. D.

WOMAN SUFFRAGE. In 1912 votes for women became a political question in the United States. Miss Jane Addams of Hull House spoke before the resolutions committee of the Republican national convention at Chicago and Dr. Anna Howard Shaw, president of the National American Woman Suffrage Association, addressed the resolutions committee of the Democratic national convention at Baltimore. Mrs. Florence Collins Porter and Mrs. Elizabeth Blaney of California were delegates to the Republican convention; Mrs. W. W. Pitzer of Colorado (sister of Champ Clark, Speaker of the House of Representatives) and Mrs. Mary Arkwright Hutton of the State of Washington were delegates to the national Democratic convention. A number of women were delegates to the national Socialist convention at Indianapolis and to the Progressive convention at Chicago. Jane Addams seconded the nomination of Theodore Roosevelt as Progressive candidate for President.

The American people were greatly impressed by the dignity and intelligence of the women who took part in these great conventions and also aided their parties in the campaigns succeeding them. Equal suffrage was made a plank in the platform of three of the national parties—Progressive, Socialist, and Prohibition—and, in a number of States, was endorsed by all five parties. At the November elections an equal suffrage amendment was submitted in six States. This amendment passed in Arizona, Kansas, and Oregon. Each one of these States is adjacent to a State which had previously

granted equal suffrage, the list being California (1911), Washington (1910), Iowa and Utah (1896), Colorado (1893), Wyoming (1869). The amendment was lost in Wisconsin and Ohio. In Michigan the majority against woman suffrage was only 760. The charge of election frauds was very freely and generally made, but in spite of the strong evidence of illegality it was decided wiser to resubmit the amendment in 1913, rather than go through the tedious and expensive process of proving fraud in the courts.

In all of the States where the amendment was submitted active campaigns were carried on during the summer. Many interesting forms of peaceful propaganda were developed. The most striking feature of these campaigns was, however, their economy, the average cost where the amendment carried being only 3 cents per woman. Two million women of the United States are now eligible to vote at all elections on the same terms as men.

The number of enrolled and dues-paying members of the National American Woman Suffrage Association on January 1, 1912, was about 100,000. This was increased to approximately 250,000 by January 1, 1913. At the annual convention of the National Association, in Philadelphia, November 21-26, there were delegates from practically all of the States of the United States. No hall in Philadelphia was large enough to hold the crowds which tried to attend the open meetings of the convention.

The most conspicuous demonstration of the year was the torchlight parade in New York on November 9 to celebrate the victories of the fall elections. Ten thousand women marchers represented the various States of the United States, the foreign countries where women are enfranchised, and the occupational and professional openings to women. There were also parades in Baltimore, at the time of the Democratic convention; in Columbus, Ohio, at the close of the suffrage campaign in that State, and in New York in May to impress on the legislature of that State the strong demand for equal suffrage. That the suffragists of the United States do not depend on spectacular demonstrations alone is shown by the fact that the National Association published and sold 3,000,000 pieces of suffrage literature in the year 1912. A votes for women moving-picture play, written and acted by suffragists, was shown all over the United States. The most prominent men and women in the country are constantly in demand for suffrage speeches. The question is now considered one of great intellectual and social importance as well as of political expediency.

Delegates have been appointed from the United States to the Congress of the International Suffrage Alliance in Budapest, June 15-20, 1913. They are Dr. Anna Howard Shaw, Miss Jane Addams, Mrs. Joseph Bowen, Mrs. Stanley McCormick (all officers of the National Association), Mrs. Emma B. Sweet, Mrs. Frederick Nathan, Mrs. Tod Helmuth, Mrs. Minnie Ruth-erford, Mrs. Henry Villard, Miss Ruutz-Reese, Miss Anna Maxwell Jones, and Mrs. O. H. P. Belmont. Mrs. Carrie Chapman Catt, president of the Alliance, has recently returned from a two years' trip around the world, in which she organized for suffrage the women of many countries, including Burmah, India, China, South Africa, and Hawaii. Delegates from twenty-six countries will be present at the congress. The International Conference of Men's Leagues

for Woman Suffrage will take place in Budapest while the woman's congress is in session. See GREAT BRITAIN, *History*.

WOMEN IN INDUSTRY. The most extensive and thoroughgoing investigation of the employment of women and children in industry, at any rate, in the United States, is contained in the *Report on Condition of Women and Child Wage-Earners in the United States*, which was issued during 1910-11-12 by the Department of Commerce and Labor. This report comprises nineteen volumes, of which the titles and authors, where specialists were employed, are as follows: "Cotton textile industry," 1044 pp.; "Men's ready-made clothing," 878 pp.; "Glass industry," 970 pp.; "Silk industry," 592 pp.; "Wage-earning women in stores and factories," 384 pp.; "Beginnings of child labor legislation," by Elizabeth Lewis Otey, 225 pp.; "Conditions under which children leave school to go to work," 309 pp.; "Juvenile delinquency and its relation to employment," 177 pp.; "History of women in industry in the United States," by Helen L. Sumner, 277 pp.; "History of women in trade unions," by John B. Andrews and W. D. P. Bliss, 236 pp.; "Employment of women in the metal trades," by Lucian W. Chaney, 107 pp.; "Employment of women in laundries," 121 pp.; "Employment of women and infant mortality"; "Causes of death among women and child cotton-mill operatives"; "Relation of occupation to criminality of women," by Mary Conyngton, 119 pp.; "Family budgets of typical cotton-mill workers," by Wood F. Worcester and Daisy Worthington Worcester, 225 pp.; "Hookworm disease among cotton-mill operatives"; "Employment of women and children in selected industries"; "Labor laws and factory conditions."

Every phase of the employment of both women and children was covered in this report, and incidentally much light was thrown on the employment of men in various industries. The cotton, the men's ready-made clothing, the glass, and the silk industries were chosen for special investigation because of the large number of women and children employed. Thus in the cotton industry such workers constitute 53.4 per cent. of all workers employed, there being altogether 60 per cent. more women than in any other manufacturing industry and more children than in any other four industries combined. The ready-made clothing industry ranks second in number of women employed and is worthy of special attention because much of it is home work. The silk industry similarly is specially dependent on women and children, who constituted in 1905 two-thirds of all wage-earners. All of the investigations were made in a thoroughgoing manner and constitute models of completeness and freedom from bias. Nevertheless the material relating as it does to the year 1908 became in many respects antiquated before the reports were published. As a whole this investigation showed clearly the immense social waste due to existing conditions of woman and child labor. Nearly everywhere the investigators found conditions undermining the health of the present generation and reducing the vitality of the next; unnecessary risk of accidents and disease; a reduction of industrial vigor due to insufficient wages and consequent insufficient standard of living; the loss of future welfare through the haphazard drifting of children into

unsuitable occupations, where ambition was soon stifled. The report showed that many factors enter into the determination of the difference between the wages of men on the one hand and women and children on the other. These wages are really fixed in different markets. The immaturity of the workers and their consequent employment in unskilled trades, the brevity of their industrial careers and their lack of organization are all causes of the low wage level for women. The report emphasizes the youthfulness of the typical woman wage-earner. Thus, in southern cotton mills 61 per cent. of the women employed were under 21; in Pennsylvania silk mills 74.2 per cent. of the women employed were under 21, 51.7 per cent. being in the age group 16-20; and fully one-half of the women in the clothing industry were under 21. Another interesting and surprising conclusion was that the girl who goes into industrial work for the sake of pin money is very rare. In the New York stores 84.3 per cent. of the women employed who lived at home contributed their entire earnings to family support; in New York factories the percentage was 88.1. The report presents clearly the viciousness of home work and recommends the abolition of home finishing on the ground that its regulation is impossible, and that its existence is a danger to the public health.

An example of the character of material and conclusions in these volumes is furnished by volume four treating of the Silk Industry in New Jersey and Pennsylvania. A limited number of mills in each State was studied intensively. In Pennsylvania mills visited, 67.8 per cent. of all the employees were found to be women, and 23.2 per cent. children, leaving only 9 per cent. men. These figures contrasted with 49.6 per cent. women, 6 per cent. children, and 44.4 per cent. men in New Jersey silk mills. Many children were found working at ages below the legal limit; and most of the mills failed to keep affidavits of children as required by law. Moreover, multitudes of false affidavits were found; so that in New Jersey silk manufacturing districts 4.7 per cent. and in Pennsylvania 16.8 per cent. of children of ages 6-13 were at work. Nightwork was found to be common in Pennsylvania, one-fifth of the mills having it. There was a sharp contrast between the wages of New Jersey and Pennsylvania operatives. The weekly wages in throwing mills in the former State were distributed as follows: For women over 16 years, 8.7 per cent. received less than \$4, 15.8 per cent. received \$4 to \$6, and 75.5 per cent. received over \$6; for girls under 16 years the percentages for the same wage groups were 40.1, 41, and 18.9 respectively. In Pennsylvania the percentages for the same wage groups among women over 16 years were 57.2, 37.1, and 5.7 respectively and among girls under 16 years, 91.6, 7.6, and 0.8. Thus the silk industry, particularly in Pennsylvania, revealed many of the characteristics of a parasitic industry with its large proportion of woman and child labor, the absence of labor organizations, and wages below normal standards of even poorly paid industries.

LEGISLATION. The most important law relating to the employment of women in industry was the Massachusetts minimum-wage law. (See MINIMUM WAGE.) Other legislation relating to women in industry was enacted in Ari-

zona, Kentucky, Maryland, Massachusetts, New Jersey, New York, and Virginia. Arizona prohibited employment of women in occupations in which they must remain standing or in or about any mine, quarry, or coal breaker. Kentucky prohibited the employment of women under 21 for more than 10 hours a day or 60 hours per week, except for domestic service and nursing. Women of any age may not be employed more than that length of time in laundries, bakeries, factories, workshops, stores, hotels, restaurants, telephone exchanges, telegraph offices, or mercantile, manufacturing, or mechanical establishments. The new Kentucky law also requires all employers of women to provide seats for them when not necessarily engaged in active work; all stores must provide at least one seat for every three females employed; and must provide wash and toilet rooms. Maryland similarly prohibited the employment of any woman in any manufacturing, mercantile, or mechanical establishment, printing office, bakery, or laundry more than 10 hours a day or 60 hours a week. If a woman is employed before 6 A. M. or after 10 P. M. she may not work more than 8 hours a day, and no woman may work more than 6 hours continually without an interval of at least one-half hour. Exception as to hours is made for Allegany County, where women may be employed as many as 12 hours per day during rush seasons, provided the average length of day for the year does not exceed 9 hours. Massachusetts directed the State board of health to investigate rooms where women are employed and to make rules regulating them. It also strengthened the law requiring the provision of seats for women employees. New Jersey limited to 10 hours a day, or 60 hours a week, the employment of women in manufacturing and mercantile establishments, bakeries, laundries, and restaurants, but mercantile establishments are excepted for six working days before Christmas; nor does the law apply to canneries. New York forbade the employment of a woman in a factory, mercantile establishment, mill, or workshop within four weeks after she has given birth to a child. It reduced the hours of factory women from ten to nine per day and from sixty to fifty-four per week; but more than nine hours a day is permitted in order to secure a short day or holiday on Saturday. Moreover, this limitation of hours does not apply to women and children over 16 in canning or preserving establishments between June 15 and October 15. Virginia prohibited the employment of women in coal mines. The ten-hour law was extended to include not only factories and manufacturing establishments but also workshops and mercantile establishments; exceptions were made of bookkeepers, stenographers, cashiers, or office assistants in fruit and vegetable packing establishments from July 1 to November 1, in mercantile establishments in towns of less than 2000 inhabitants, and in mercantile establishments on Saturdays.

BIBLIOGRAPHY. Besides the government reports above noted the following new books appeared: *Saleswomen in mercantile stores*, Baltimore, 1909, by E. B. Butler; *Fatigue and Efficiency*, by Josephine Goldmark; *Making a business woman*, by A. S. Monroe; *Woman and social progress*, by S. and N. M. Nearing; and a series of pamphlets by the Women's Educational and Industrial Union of Boston on Medi-

cal social service, Organized charity, Settlement Work, and Social service for children as vocations for women.

WOOD FROM STRAW. See CHEMISTRY.

WOOD, HARRY BARNES. An American educator, died April 22, 1912. He was educated at Williams College and at Hamilton College. After graduating from the latter institution he taught in several places and received a master's degree from Hamilton in 1899. In the same year he was appointed professor of Latin in that college and remained there until 1911, with the exception of a few years spent in study in Germany. In the autumn of 1911 he became a teaching fellow in Latin at the University of Wisconsin.

WOODWORTH, WILLIAM McMICHAEL. An American zoölogist and educator, died May 28, 1912. He was born in San Francisco, Cal., in 1864, and graduated from Harvard College in 1888. He was assistant in microscopic anatomy in Harvard from 1889 to 1891; inspector from 1891 to 1897, and assistant in charge of the Museum of Comparative Zoölogy from 1898 to 1900. He was keeper of this museum from 1900 to 1905. He was editor of the *American Naturalist*. He was a member of many learned societies and associations.

WORKINGMEN'S INSURANCE. The past few years have seen a very comprehensive movement for the provision of insurance against sickness, invalidity, old-age, unemployment, and industrial accidents, and diseases throughout the world. In Germany the government has long given attention to the subject; more recently England, France, and Switzerland have taken it up. In the United States provision is being made through State action for insurance against and compensation for industrial accidents and diseases. (See EMPLOYERS' LIABILITY and WORKMEN'S COMPENSATION.) Insurance for sickness, invalidity, and old age are still in this country in the control of voluntary organizations, as the industrial insurance companies and fraternal societies. (See INSURANCE.) Massachusetts has provided industrial insurance by State action. (See INSURANCE.) Numerous corporations now provide retirement pensions as do many cities and some States for civil service employees. (See OLD-AGE PENSIONS.) The most comprehensive schemes yet instituted by corporations are described below.

AMERICAN TELEPHONE AND TELEGRAPH COMPANY. This corporation and its associated companies, the Western Union Telegraph and the Western Electric, announced in November that it would make available January 1, 1913, a fund of ten million dollars for old-age pensions, sick benefits, compensation for accidents, and life insurance. The companies involved employed 175,000 workers, all of whom were to share in the benefits, at an annual cost to the employers of \$1,000,000. The fund was to be added to by annual appropriations. The plan did not call for any contributions from the employees themselves. As to retirement pensions the plan provided that male employees of 60 years of age or over who have been 20 years or more in the service of one of the companies may retire on a pension. The company may retire any

employee at 55 after 25 years of service. Women employees reach pensionable age 5 years younger than men. Any employee may be pensioned after 30 years of service regardless of age. The amount of the pension will be one per cent. of the average annual wage for 10 years multiplied by the number of years of service; but no pension will be less than \$20 a month. Compensation for accidents occurring in the performance of work for the company will be paid at the rate of full pay for 14 weeks and half pay for the remaining period of disability, but not beyond 6 years. Employees disabled by sickness or accidents not occurring in the course of regular employment who have been employed at least 10 years will receive full pay for 13 weeks and half pay for 39 additional weeks; those employed less than 10 years, but more than 5, will receive full pay for 13 weeks and half pay for 13 weeks; those employed from 2 to 5 years will receive full pay for 4 weeks and half pay for 9 weeks. Those employed less than 2 years may receive some sick or disability benefit at the discretion of the heads of departments.

Perhaps the most unique feature of this scheme is the payment of death benefits not only in cases of fatal accidents while on duty, but also in cases of death from sickness or accident at other times. In case of death from an accident while on duty a payment equal to 3 years' wages, but not exceeding \$5000, will be paid to the victim's dependents. In case of death from sickness or accident outside of duty this payment will equal one years' wages for those employees who have served 10 years or more, and one-half of one year's wages for those who have served from 5 to 10 years, the maximum payment being \$2000. If in any State the provisions of this plan should be less liberal than those required by workmen's compensation laws the latter will be followed. The funds for the payment of these various benefits will be administered by committees of five to be appointed by the board of directors for each company.

WISCONSIN. In December plans were formulated for the presentation in the Wisconsin legislature of a bill providing for sickness insurance for working men and women. The administration was to be in the hands of the State industrial commission and was to be correlated with that of the workmen's compensation law. It provided for contributions by employers and employees, but not by the State. The industrial commission was given discretionary power to decide the amount to be paid on claims.

ABROAD. THE ASSOCIATION ON SOCIAL INSURANCE met in Zurich, Switzerland, during the second week in September. The following topics were discussed: The extension of obligatory insurance to persons other than workmen; supplementary insurance through voluntary organization; the financial burden of social insurance; international statistics of industrial accidents; petty accidents. It was generally agreed that wage-earners and all other persons who need insurance should be either required to take advantage of State insurance schemes or be permitted to do so; if excluded from compulsory insurance plans such persons should be actively assisted in securing some voluntary form of insurance. There was no general agreement as to the relative scope of compulsory and voluntary insurance.

GREAT BRITAIN. By far the most comprehensive and far-reaching social insurance legislation of recent years is the national insurance act passed December, 1911, by the British Parliament and effective July 15, 1912. This act occupies nearly eighty large closely printed pages, being divided into three parts and an appendix. Part 1 deals with health insurance; Part 2 with unemployment insurance; and Part 3 with general provisions. In the first part insurance against sickness is made compulsory upon all employed persons sixteen years of age or over, except those in the military and naval services, those employed by public authorities for whom provision has been made otherwise, and certain employees of railways, teachers, and a few others who are provided for by other acts. Any of these persons excepted may be brought under the compulsory provision at the discretion of the insurance commissioners. Provision is made also for the voluntary insurance of persons not subject to the compulsory provisions who are engaged in a regular occupation and wholly or mainly dependent on their own earnings; but no person may be a voluntary contributor whose annual income exceeds £160 (\$778.64), unless he has been previously insured for at least five years. The act makes no discrimination as to sex or citizenship, residence only being required.

HEALTH INSURANCE. The administration of the health insurance is entrusted in the first place to a central body of insurance commissioners with extensive powers. Under their authority an insurance committee is to be set up in every county, with a membership of from 40 to 80 persons, some of whom must be women. These county committees are authorized to subdivide counties into districts over which district insurance committees shall have supervision. These latter must make reports on the health of insured persons and sanitary conditions of their territory and must disseminate information. In cases of excessive sickness these district committees may make investigations at the expense of persons charged with neglect or otherwise with causing unhealthful conditions.

The normal premium for health insurance is 14 cents for men and 12 cents for women, made up of contributions from employer, employee, and the public funds. These contributions are proportioned to wages. Thus, if wages equal or exceed 60.8 cents, the employer pays 6.1 cents, male employees 8.1 cents, and female employees 6.1 cents per week. If wages fall between 49 cents and 61 cents a day, the employer pays 8 cents for male employees and 6 cents for female employees and the employee pays 6 cents. If wages fall between 37 cents and 49 cents a day, the employer pays 10 cents for men and 8 cents for women per week, while the employee pays 2 cents and the public funds contribute 2 cents. If wages do not exceed 37 cents a day the employer pays 12 cents for men and 10 cents for women per week, the employee pays nothing, and the public funds contribute 2 cents. These rates apply to all employees at least 21 years of age. Special provision is made for younger employees and certain rules are laid down regarding the contributions of persons who have reached the age of 70. Special rates are also provided for voluntary contributors.

The benefits of the health insurance consist of medical attendance, medicines, and appli-

ances; and a special weekly sick benefit. This benefit amounts to 10s (\$2.43) per week for men and 7s 6d (\$1.83) for women during the first 26 weeks. If sickness continues beyond this period the benefit is technically known as disablement or invalidity benefit and amounts to 5s (\$1.22) per week for either sex during the continuance of incapacity. Special maternity benefits are provided. The payments to unmarried minors, to some persons above 50 years of age, and to married women are smaller. If insured persons are entitled to compensation or damages under compensation or liability acts the sick benefit is reduced so that the total shall not exceed the amount provided in the insurance act, unless the benefit from other sources is greater than the sick benefit, when no sick benefit at all shall be paid. Persons supported in workhouses, hospitals, asylums, and elsewhere by public funds receive no sick, disablement, or maternity benefits. A special fund of \$7,500,000 the first year and large annual additions are set aside for the establishment of sanatoria and other facilities for the cure and prevention of tuberculosis.

The administration is extremely complex, the Local Government Board, the Board of Education, the Home Office, the Board of Trade, and the County, Borough, and District Councils all being given authority to promote public health in various ways. Extensive use is made of approved societies. These include the friendly societies, trade unions, provident societies, associations of persons insured in industrial insurance companies and other similar groups. These societies receive the contributions of their own members. Persons who are not members of such societies pay through the post office, by means of stamps, these contributions being under the direct control of the insurance committees.

UNEMPLOYMENT INSURANCE. The second division of the act provides for compulsory insurance against unemployment in the engineering trades. These include building, the construction of railroads, docks, harbors, canals, etc.; shipbuilding, mechanical engineering, iron founding, the construction of vehicles, and woodworking. The funds for this benefit are provided by workmen, employers, and the public treasury. Workmen and employers each contributed 5d (10c) weekly per workmen and the public treasury adds to this sum an amount equal to one-third of it. The employer is expected to make the contribution for both himself and his workers, deducting the latter's share from wages. In order to receive unemployment insurance the worker must show that he has been employed in an insured trade for not less than a part of twenty-six different weeks during the preceding five years, that he is capable of working but unable to find suitable employment, and that he has not exhausted his right to employment benefits. In order to obtain employment a workman is not required to accept employment in a community other than that of his residence or at a lower rate than is customary for the given trade in any district. In case, however, loss of employment results from a trade dispute, no employment benefits shall be paid, unless the worker obtains employment elsewhere in an insured trade. Workers who lose their jobs through misconduct or leave them without just cause will receive no benefits for six weeks after the date of such loss of employment. Otherwise benefits

begin after the first week of unemployment and amount to 7s (\$1.70) per week, unless some other rate is fixed upon. Benefits are not payable for more than 15 weeks in any period of 12 months, nor in general will benefits exceed one week's benefit for every 5 weekly contributions paid. The act makes provision for the determination of claims and the arbitration of differences under both health and unemployment sections and also includes many exceptions and other conditions made necessary by existing institutions and varying social conditions. See UNEMPLOYMENT.

THE DOCTORS' OPPOSITION. Even before the act passed, the doctors, organized in the British Medical Association, had united in opposition. They succeeded in effecting some changes. They were, however, not satisfied and the association's opposition continued to the close of the year. Although 27,400 members of the association signed a pledge in 1911 not to accept the terms of the chancellor, a poll in the fall of 1912 brought out only 10,000 against working under the act. One of the original objections of the doctors raised was that well-to-do persons would come in under the act and thus a principal source of income would be cut off. This was met by fixing an income limit of £160 for insurable persons. A second objection dealt with the administration. The administration of the medical benefit was placed in the hands of local insurance committees under the general supervision of the insurance commissioners. The doctors objected to control by lay or non-professional committees. This was answered by showing that the act provided for the enrollment, known as a panel, of all doctors willing to serve in various districts; for the right of free choice from such list by the insured person; for payment according to certain general rules; and for participation of the local committee of medical men in all general questions affecting the administration of medical benefit.

The principal objection dealt with the amount of remuneration. The government was willing to grant 6s per capita of insured persons, but later agreed to grant 7s for the doctor, 1s 6d for drugs, and an additional 6d for drugs, if needed, otherwise to be added to the doctor's fee. The doctors at first demanded 10s, but agreed to compromise on 8s 6d as their per capita fee, not including medicines. The existing colliery and works systems already in existence were to be continued. Moreover, special payment for extras was provided. The reason for lack of agreement was largely the difference of opinion as to the average amount of attendance per head of insured persons that would be required. Investigations covering the incomes of medical men in five cities were variously interpreted. Other statistical tables were prepared from the experience of contract physicians and likewise variously interpreted. Late in the year the chancellor, by way of showing the utmost reasonableness, appointed a commission to investigate, the question of increased remuneration to be determined upon its report. Opinion was sharply divided as to whether the demands of the doctors were excessive or not. On the basis finally granted by the government a physician having 2000 insured persons on his list would have a gross income of \$4500 per year. This would include the cost of medicines and other expenses. However, many thought 2000 a larger number than efficient

services would permit. The health provisions were to become effective January 15, 1913. At the close of the year it was reported that about 10,000 doctors had accepted the government's terms, there being a sufficient number in all of the 121 insurance areas, except in parts of London and the Manchester district, both Unionist strongholds.

GERMANY. In 1911 the numerous laws, regulations, and judicial interpretations bearing on the various systems of national insurance were codified. These systems are three: Sick insurance, accident insurance, and invalidity insurance, which includes old-age insurance for workmen at least seventy years of age. The sick insurance system includes some 23,000 local societies with nearly 14,000,000 members. About 45 per cent. of the members receive sick aid annually. Sickness insurance covers illness for periods less than six months; funds are derived from equal contributions by employers and employees. Invalidity insurance includes sickness for periods longer than six months and old-age pensions. Nearly 16,000,000 persons are insured under it, receiving pensions of \$3.00 to \$3.50 per month. Funds are contributed equally by employers and employees. The accident system provides definite compensation for injuries. Employers have combined into mutual insurance societies, of which there are about fifty for agriculture and nearly seventy for industry and trade. Funds are provided by assessments upon employers varying according to trade risks. The total annual revenues for all three systems preceding 1912 were about \$210,000,000, and the total expenditures about \$165,000,000. The new law extended the system of sick insurance to farm laborers, domestic servants, and casual laborers; extended the pension system to include widows and orphans of insured laborers; and increased the scope of the accident system. As a result the total expenditures were expected to increase by \$32,000,000. In addition to these three systems of workmen's insurance the imperial government began, under the law of 1911, an independent system for other persons having incomes less than \$1200 per year.

The 1911 changes revived the problem of the relation of the doctors to the sickness societies. This had, as in 1912 in Great Britain, caused much friction when the system of sickness insurance was established in the early eighties. Previous to the revision of 1911 the income limit of persons insurable under the sickness system was about \$500; the new law raised the limit to about \$625. The doctors manifested special opposition to treat on ordinary insurance terms persons who were enabled to take insurance by this extension of the income limit. The doctors preferred payment in proportion to services rendered, whereas the sickness societies preferred to pay in a lump sum, usually so much per member per annum. Though not entirely settled, compromises in some places were reached by a society or federation of societies and the association of doctors on the basis of a capitation fee. The total payment by the society was to be divided among the doctors by their own association. This obtained at Leipzig, where the sickness society had 200,000 members, and also at Munich, Frankfurt-am-Main, and Stuttgart. Such an arrangement permits special payment for special services and does not include hos-

pital treatment. This plan allows for free choice of doctor and renders control of the doctors by the societies easier. That is, the welfare of the societies requires that the doctors be not too lenient in giving certificates of inability to work; but, on the other hand, the doctors must be unhampered by ignorant persons. In Germany primary control of the doctors is exercised through committees of their own association to which the society makes complaints. There is a conciliation committee composed of representatives of the society and of the doctors' association to settle disputes and other matters of common interest, and an arbitration committee with an impartial chairman as a court of final appeal. In addition, societies are at liberty to have special medical advisers in their exclusive employ.

SWITZERLAND. A new sickness and accident insurance law was enacted by the Federal Council of Switzerland on July 13, 1911, and approved by a referendum vote of the Swiss people on February 14, 1912. By this law the confederation will grant subsidies to recognize sick insurance funds. Sickness insurance may be made compulsory by the cantons, either generally or for special classes of persons. Public funds may be established for such insurance, and though employers are not themselves obliged to contribute they must oversee the payments of their employees whenever the latter are compulsorily insured in such funds. Sick benefits consist of medical care and medicines; a daily indemnity for loss of time of not less than one franc (19.3 cents); benefits must be provided for at least 180 days each year. Special provision is made for women during confinement.

For accidents the confederation granted a subsidy of five million francs (\$965,000) as working capital and an equal amount as a reserve fund for the national accident insurance fund. The confederation also pays part of the expense of administration; each canton is entitled to one agency of this fund. Accident insurance is made compulsory for all employees in the transportation and postal services, in factories, in the building trades, engineering works, telegraph and telephone construction and maintenance, in the operation of mines, quarries, and gravel banks, and in industries which produce or use explosives. Insurance is given against accidents, whether occupational or otherwise. An occupational accident is one occurring to a worker while actually employed. Diseases essentially due to employment in designated classes of work are considered accidents within the meaning of the law. The benefits of the accident insurance include medical attendance, medicine, indemnity for loss of time, whether temporary or permanent, and death annuities. The indemnity for disability amounts to 80 per cent. of the earnings, but no earnings above 14 francs (\$2.70) per day are considered. If the disability be permanent the total annuity equals 70 per cent. of the annual earnings. For partial disability proportionate deductions are made, no annual earnings in excess of 4000 francs (\$772) being considered. An annuity may be revised at any time within three years and afterwards at the expiration of the sixth and ninth years. In case of death the annuity to a widow or to an infirm or permanently disabled widower equals

30 per cent. of the annual earnings. On remembrance a widow is allowed a lump sum equal to three times her annuity. In addition, each legitimate child receives 15 per cent. of the annual earnings of the insured person until 16 years of age. Provision is made also for other relatives, but the total of all annuities cannot exceed 60 per cent. of the earnings of the insured person. Employments are classified according to risk, occupational accident premiums being paid entirely by the employer. For non-occupational accidents the insured pays three-fourths and the confederation one-fourth of the premium. In all cases the employer acts as the collector. Any person not subject to the provisions of compulsory insurance may insure voluntarily.

WORKMEN'S COMPENSATION. This is a term used to designate that form of compensation for industrial accidents which has come to replace employer's liability. Under the older system the employer was required to compensate a workman injured while in employment only when the employee could show in a suit at law that the employer had been grossly negligent, that the worker had not been negligent, and that the accident was not due to the carelessness of a fellow employee. Under the common law the employer was securely entrenched behind the rules of assumed risks, contributory negligence, and the fellow-servant doctrine. Employers' liability laws gradually reduced the employer's security by modifying these doctrines in various respects, but still imposing on the injured worker the necessity of bringing suit in court. The employers at the same time insured themselves against such suits in employers' liability insurance companies, which assumed the obligation of fighting the employees' suits and of paying penalties imposed. Thus the worker was forced to assume the costs of repeated law suits before he could secure any damages. Statistics showed that not more than 45 per cent. of the premiums paid by employers to insurance companies were finally paid to injured workers. Moreover, actual statistical investigation showed that between 60 per cent. and 70 per cent. of injured workers received no compensation whatever. Even when compensation was secured, the expenses involved so reduced it that the remainder was wholly inadequate to offset the economic loss involved in the injury itself. Thus many families were permanently reduced to a lower standard, even to permanent poverty, by industrial accidents. The compensation principle introduced into England and continental countries fifteen to twenty years ago has within the past two years found extensive adoption in the United States. Because most of the American legislation still takes the form of employers' liability laws, the subject is treated more comprehensively under **EMPLOYERS' LIABILITY**.

The advantages of the compensation principle may be briefly summarized as follows: (1) It furnishes certain, prompt, and reasonable compensation to injured workers and their dependants; (2) it removes from the courts the numerous cases growing out of employers' liability litigation; (3) it relieves charity of the poverty due to uncompensated accidents; (4) it is more economical, since the costs of lawyers, witnesses, insurance companies, and court trials are eliminated, and because it gives to

the worker a much larger proportion of the cost to employers; (5) it increases good will and stimulates accident prevention; (6) it furnishes a basis for accurate statistical knowledge of phases of industrial and social life heretofore neglected.

WORLD PEACE FOUNDATION. See **ARBITRATION, INTERNATIONAL**.

WORLD'S FAIR IN TOKYO. See **EXPOSITIONS, Japan**.

WRESTLING. Several professional matches were held in 1912, but Frank Gotch had no difficulty in retaining his title of world's champion. The only one whose showing during the year makes him a possible contender for the highest honors is S. Zybaszko and a match between him and Gotch will doubtless take place in 1913. Of international interest were the bouts held at the Olympic games (q. v.), in which Finland's wrestlers showed marked superiority. The winners of the national championships held under the auspices of the Amateur Athletic Union were: 105-pound, G. Taylor, National Turn Verein, Newark; 115-pound, W. Strobach; 125-pound, Gus Bauer, National Turn Verein; 135-pound, E. Halikman, Educational Alliance; 145-pound, Gus Peterson, Harlem Y. M. C. A.; heavyweight, E. Kaino, Finnish-American A. C. Cornell won the inter-collegiate championships. Princeton was second, Pennsylvania third, and Columbia fourth. The winners of the main bouts follow: 112-pound, T. I. S. Boak, Cornell; 125-pound, J. D. Matchat, Cornell; 135-pound, H. H. Ormond, Princeton; 145-pound, J. H. Frantz, Princeton; 158-pound, R. D. Shaw, Cornell; 175-pound, S. Bame, Cornell; heavyweight, J. L. Collins, Cornell.

WRIGHT. See **NAVAL PROGRESS**.

WRIGHT, SOPHIE B. American philanthropist and educator, died June 10, 1912. She was born in 1886 in New Orleans and when she was three years old she fell and hurt her back and hips so badly that for six years she was strapped to a chair. She was able to attend school, however, and at the age of fourteen opened a school for girls, which she conducted in the forenoons, while in the afternoons she taught in a normal school to pay for home lessons in languages. Observation of the ignorance of many of the boys of the city gave her determination to establish means of giving them some education. She soon established the Home Institute, which had for its especial duty the care of poor boys in the city of New Orleans. She also started a night school. She was obliged to close her school in 1897 on account of yellow fever, but she reopened it as a depot of supplies for the sick and with her teachers went through the city giving help. The attendance at her night school increased so rapidly that within a year there were 1000 pupils in attendance, and her work as a moral agent on the boys of the city had remarkable results. After many years she began to receive financial assistance from wealthy men of the city. She then established a hospital for crippled children of the city and engaged in many other branches of charitable work. Societies throughout the State combined to raise money to pay off mortgages which threatened to ruin her enterprises. She became known throughout the country as a leader of education and one of the deepest thinkers among the women of the

South. She was one of the promoters of "Rest Awhile," the home of the King's Daughters, where many mothers and children are entertained throughout the summer. She was for years before her death so afflicted with asthma that she was scarcely able to sleep. In spite of this she continued her work. Her night school and home institute became one of the most successful among the schools of the South.

WRIGHT, WILBUR. An American aeronaut and inventor, died May 30, 1912. He was born near Millville, Ind., April 16, 1867. He was the son of Milton Wright, a bishop of the Church of the United Brethren. His formal education was obtained from the public and high schools of Dayton, Ohio. Wilbur Wright and his brother, Orville D., early developed a talent in mechanics, and at the time of the popularity of the bicycle they conducted a small shop in Dayton, Ohio, for repairing and building bicycles. The brothers became interested through the experiments carried on by Professor Langley, Octave Chanute, and others, in the science of aeronautics and began experiments at Dayton in flying with kites and afterwards with a device known as gliders.

In the experimental work and in the final results which crowned the efforts of Orville and Wilbur Wright with success, the portions contributed by the two brothers are so closely related that it is impossible to speak of the definite accomplishments of one without also including those of the other. Those who knew them both well have said that to Orville Wright should be credited the larger part of the theoretical work, while to Wilbur, who was of a more practical turn of mind, must be credited the greater share of bringing these theories into actual practice. There is, however, no definite proof of this. The brothers would not at any time discuss the relative share of each in their inventions.

The two brothers found their experiments at Dayton hampered by the physical contour of the country and by the too pressing curiosity of their neighbors. Accordingly in 1903 they began carrying on experiments at Kittyhawk, N. C. By this time their experiments had advanced to such a point that they had produced a machine in which they could remain in the air a minute at a time. This machine was equipped with a 12-horsepower motor. The first flight in this aeroplane covered half a mile in distance and it was made in 59 seconds. This formed the first actual success of a practical air machine. Up to this time the experiments of the Wright brothers had been regarded by the public with an incredulity and in some quarters with ridicule. The final attainment of flying, however, changed this into a serious consideration of their work. Soon after came their invention of warping planes by which the making of air curves and safe steering became possible. In 1905 they constructed a larger machine and with this a flight of 24¼ miles was made. During this flight the machine remained in the air thirty minutes.

In 1906 they built several additional machines. In 1908 Wilbur Wright went to France, where his achievements and those of his brother had received much more recognition than in the United States. His brilliant work in France was acclaimed by European authorities as the successful solution of the problem of mechanical flying. It was admitted that his skill in the manipulation of the aeroplane and his complete

knowledge of the conditions involved in its use were far in advance of the best French work. On September 21, 1908, he made a continuous flight of 1 hour and 31 minutes, and in the trial for the Michelin prize of \$4000, was in the air continuously for 1 hour, 53 minutes, and 59 seconds, covering a distance of 61½ miles at a speed of 36 miles an hour. This was by far the most successful flight made up to this time. The success of Mr. Wright's experiments in France enabled the brothers to dispose of the French patent rights for \$100,000. On December 31, 1912, Mr. Wright made a flight from Le Mans lasting 2 hours and 18 minutes, and covering 76 6/10 miles. While Wilbur Wright was in France making these exhibitions, his brother, Orville, had conducted similar trials prior to the acceptance of the Wright aeroplane for the United States army. On September 17, 1908, the aeroplane in which were Mr. Wright and Lieut. T. E. Selfridge, fell, and Lieutenant Selfridge was killed and Mr. Wright seriously injured. The trials were renewed in July, 1909, and resulted in the acceptance of a Wright machine by the United States army at a price of \$30,000.

During the Hudson-Fulton celebration in New York City in October, 1909, Wilbur Wright flew from Governor's Island, New York Bay, over the Hudson River as far as Grant's Tomb and returned.

Following the practical solution of flying, Mr. Wright and his brother devoted the greater part of their attention to improving and perfecting their designs with the object of making safety in flight as nearly attainable as possible. Personally they did not take part in exhibitions of flying, which was such a feature of the years 1910-11. Representatives of their company, however, flew at these meetings and in nearly every case demonstrated the superiority of the Wright machines. Mr. Wright and his brother consistently discouraged feats of flying which called for unusual displays of courage and skill. In 1910 they produced a new machine which was marked by several improvements.

In 1911 the brothers returned to the scene of their original notable experiments at Kittyhawk, N. C., where they made trials with a motorless glider, with the object of perfecting flying in the face of the wind. These experiments were conducted chiefly by Orville Wright. Alleged infringement of their patents, both in the United States and in foreign countries, resulted in the bringing of suits by the Wright brothers against a large number of aviators. The greater number of these suits had not been finally decided at the time of the death of Wilbur Wright.

Although several other experimenters had nearly reached the point of successful flying at the time when the Wright brothers actually reached it, it is generally conceded that they were the pioneers in actual flying in heavier-than-air machines. It was not, however, until Wilbur Wright made his successful exhibitions in France, which were succeeded by other trials in other countries of Europe, than the American public awoke to a real conception of the value and importance of their achievements. This was due partly to the fact that there was in the United States no such interest in flying as prevailed in some countries of Europe, but more especially to the character of the two brothers. Wilbur Wright, especially, was extremely reticent and owing to his disinclination

to speak of the experiments until they had succeeded little was actually known of the results until the flights of Wilbur Wright in France and of Orville Wright at Fort Myer, Va., gave them the first place among the aeronauts of the world. In 1909 Wilbur Wright was awarded a gold medal by the French Academy of Sciences and he received many honors from scientific societies both in the United States and foreign countries. These honors he accepted with a modesty which amounted almost to diffidence. Mr. Wright died after a long illness of typhoid fever.

WÜRTEMBERG. See GERMANY.

WYOMING. POPULATION. According to the Census Bureau statistics compiled during 1912, out of the total population, 145,965 in 1910, 27,146 were foreign-born whites, compared with 16,582 in 1900. Of these the largest number, 4013, came from Austria; 2984 from England; 2293 from Sweden; 2629 from Germany. Other European countries were represented by smaller numbers. The negroes in 1910 numbered 2235 and the mulattoes 293. In 1890 the negroes numbered 982 and the mulattoes 251.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1912 are shown in the table below:

		Acreage	Prod. Bu.	Value
Corn	1912	16,000	363,000	\$ 236,000
	1911	13,000	195,000	148,000
Wheat	1912	76,000	2,181,000	1,745,000
	1911	69,000	1,794,000	1,687,000
Oats	1912	205,000	8,569,000	3,171,000
	1911	190,000	6,555,000	2,278,000
Rye	1912	3,000	57,000	37,000
	1911	2,000	40,000	36,000
Potatoes	1912	11,000	1,540,000	924,000
	1911	10,000	420,000	588,000
Hay	1912	452,000	a 869,000	7,387,000
	1911	330,000	a 693,000	7,138,000

a Tons.

MINERAL PRODUCTION. The value of the production of gold, silver, and copper in the State in 1911, according to the United States Geological Survey, was \$34,407, an increase of \$2173 over the value of these metals for 1910. The output of gold was valued at \$19,200, an increase of \$16,001. The production of copper in 1911 was 118,584 pounds, valued at \$14,823. This was a decrease of 103,755 pounds from the production of 1910. This was due chiefly to the idleness of the Penn-Wyoming mine and smelter in Carbon County. The decrease in the copper output caused a decline in the smelter production from 1478 ounces in 1910, valued at \$798, to 725 ounces, valued at \$384, in 1911.

The coal production of the State in 1911 was 6,744,864 short tons, valued at \$10,508,863. As in most of the other States in the Rocky Mountain region, the coal production of Wyoming was considerably smaller than in 1910, when a record output was obtained. The output in 1911 showed a decrease of 788,224 short tons in quantity and of \$1,197,324 in value.

The production of petroleum in the State in 1911 was 186,695 barrels, a marked increase over the production of 1910, which was 115,430 barrels. This increase included the production of Utah.

MANUFACTURES. The most important general results of the manufacturing census, taken in 1910, together with the percentage of increase from 1904 to 1909, are as follows:

	Number or Amount 1909	1904	P. C. of Inc. 1904-'09
Number of establishments	268	169	58.6
Persons engaged in manufactures	3,393	2,163	56.9
Proprietors and firm members	263	150	75.3
Salaried employees	263	179	46.9
Wage earners (average number)	2,867	1,834	56.3
Primary horsepower	7,623	3,604	111.7
Capital	\$6,195,000	\$2,696,000	129.8
Expenses	5,594,000	3,189,000	75.4
Services	2,392,000	1,467,000	63.1
Salaries	311,000	206,000	51.0
Wages	2,081,000	1,261,000	65.0
Materials	2,608,000	1,301,000	100.5
Miscellaneous	594,000	421,000	41.1
Value of products	6,249,000	3,523,000	77.4
Value added by manufacture (value of products less cost of materials)	3,641,000	2,222,000	63.9

The State has as yet few manufacturing industries. The most important in point of number of wage earners and value of product were the industries connected with cars and general shop construction and repairs by steam railroad companies. In these industries were employed 1690 persons and the product was valued at \$2,337,000. In the lumber and timber products were employed 648 wage earners, and the product was valued at \$751,000. Other industries were flour and gristmill products, printing and publishing, manufacture of butter, cheese, and condensed milk, manufacture of bread and other bakery products, and the brewing of malt liquors. The wage earners in the State in 1909 numbered 2867, of whom 46 were women. The wage earners under 16 years of age in the State numbered 12 and of these, 11 were boys. The prevailing hours of labor for the great majority of the wage earners ranged from 60 to 72 a week, only 16.9 per cent. being in establishments operating less than ten hours a day. Of the total number of wage earners, 58.9 per cent. were employed in the railroad repair shops, and practically all of these operate between 60 and 72 hours a week. The only important manufacturing centre is Cheyenne, and in this city were 853 wage earners in 1909.

FINANCE. The receipts for the fiscal year ending September 30, 1912, were \$1,178,000, and the expenditures for the same period were \$895,748. Including the balance on hand at the beginning of the fiscal year, there was a balance at the end of the year of \$1,185,047. The chief sources of income are from State taxes and land rentals. The chief expenditures are for the maintenance of the State government and State institutions. The State debt amounts to \$117,000.

POLITICS AND GOVERNMENT

The legislature did not meet in 1912 as the sessions are biennial and the last was held in 1911. The next session, known as the Twelfth Legislature, convenes January 14, 1913. There was no election of State officers in 1912. Governor Joseph M. Carey was elected in November, 1910, and inaugurated January, 1911, for a term of four years. The next general State election will be held in November, 1914. The Republican State convention on May 13 instructed six delegates of the State for President Taft. The Democratic delegates were pledged to

vote for Champ Clark. The election on November 5 resulted as follows: Wilson, 15,310; Taft, 14,560; Roosevelt, 9232; Chafin, 434; Wilson's plurality was 750. Agriculturally, the year 1912 was one of the most prosperous in the history of the State. Crops with and without irrigation were unprecedented.

STATE GOVERNMENT. Governor, Joseph M. Carey; Secretary of State, F. L. Houx; Treasurer, J. L. Baird; Auditor and Commissioner of Insurance, R. B. Forsyth; Adjutant-General, M. C. Barkwell; Attorney-General, Douglas A. Preston; Superintendent of Public Instruction, Rose Baird—Houx, Baird, and Preston, Democrats; Carey, Progressive; rest Republicans.

JUDICIARY. Supreme Court: Chief Justice, R. H. Scott; Associate Justices, Cyrus Beard, Charles N. Potter; Clerk, W. H. Kelly—all Republicans.

STATE LEGISLATURE, 1913. Republicans, Senate, 15; House, 31; joint ballot, 46. Democrats, Senate, 12; House, 26; joint ballot, 38. Republican majority, Senate, 3; House, 5; joint ballot, 8.

The representatives in Congress will be found in the article UNITED STATES, section *Congress*.

WYOMING, UNIVERSITY OF. A State institution for higher education at Laramie, Wyo., founded in 1886. The total enrollment in all departments of the university in the autumn of 1912 was 317. The faculty numbered 41. The university consists of the colleges of liberal arts, agriculture, engineering, the normal school, departments of commerce, home economics, and music, university extension, and a preparatory school. During the year a new agricultural hall, to cost \$100,000, was begun. This will make the seventh building on the campus of the university, which contains 54 acres. In addition it has two farms adjacent to the city, containing 1100 acres. The university owns, scattered throughout the State, about 130,000 acres of land. By constitutional provision these lands cannot be sold for less than \$10 an acre, and the money so realized is to form an endowment fund, the interest of which is to be used for current expenses, but the principal of which cannot be touched. The library contained about 30,000 volumes. President, Charles O. Merica, LL. D.

YACHTING. The year 1912 was a banner one in yachting, and the interest in motorboating also showed a marked increase. Among the large schooners to distinguish themselves during the year were M. F. Plant's *Elena* and E. W. Clark's *Irolita*. The *Elena* won the Astor Cup during the cruise of the New York Yacht Club and the *Irolita* captured the Commodore's Cup. In the sloop class G. M. Pyncheon's *Istalena* won the Astor Cup for sloops, while E. T. Hall's *Winsome* was victor in the King's Cup race. The *Aurora*, owned by Cornelius Vanderbilt, also captured several valuable prizes during the season. To determine the superiority among these three sloops a special race was sailed, which the *Istalena* won. In class P, H. C. Smith's sloop *Corinthian* and W. H. Child's *Joyant* made the best showings. E. Randolph's *Helen II.* carried off the laurels in the schoonerette class, P. V. Griffin's *More Joy* in class Q, C. Mallory's *Cliphora* in the American raceabout class, and G. G. Fry's *Tautog* in the American yacht dory class. The best percentage of the season was attained by

G. Corry's *Little Dipper* of the star class, which captured 10 firsts and 1 second out of 12 starts. The Richardson International Cup for the supremacy of the Great Lakes was won by the *Patricia* of Canada. The longest ocean race was from Los Angeles to Honolulu, 2600 miles. It was won by Captain Harris' schooner, the *Lurline*, in 335 hours, 16 minutes.

In motorboating, the record-breaking performances of J. S. Blacton's *Baby Reliance II.* and *Baby Reliance III.* were especially noteworthy. The *Baby Reliance III.*, driven by a 12-cylinder engine in a mile trial against time, covered the distance in 1 minute, 7 seconds, or at the rate of 53.73 knots an hour. Equipped with an 8-cylinder engine, the same boat did 35 miles in 47 minutes, 39 seconds. The *Baby Reliance II.* in the international race at Huntington, which was won by E. M. Edgar's British boat, the *Maple Leaf IV.*, did one lap of 7¼ miles in 11 minutes, 43 seconds. The *Baby Reliance II.* also added another wonderful performance in winning the E. R. Thomas interlake championship trophy, by covering 35 miles at an average speed of 46.15 knots.

YALE UNIVERSITY. The total enrollment in all departments in the autumn of 1912 was 3282, divided as follows: Graduate school, resident, 392; non-resident, 82; college, 1127; Sheffield Scientific School, 1107; art school, 43; music school, 103; forest school, 40; department of theology, 90; department of medicine, 43; department of law, 138. The faculty numbered 539, of whom 128 were professors, 93 assistant professors, 134 instructors, 78 assistants in instruction, and 106 assistants in administration. Among the new appointments in the faculty were the following: Ralph Waldo Gifford, formerly of Fordham University, was appointed professor of testamentary law in the law school; Julius Petersen of the University of Munich was appointed professor of German; John Woolman Churchman, formerly of Johns Hopkins University, was appointed professor of surgery in the medical school, and Henry Gray Barbour was appointed assistant professor of pharmacology. The beginning of the collegiate year saw the completion of the new Wright dormitory, which, for the first time, makes it possible for every member of the college to live on the campus. This is the culmination of the task undertaken a quarter of a century ago by Dean Henry Parks Wright, who planned that at some time in the future a sufficient number of buildings should be provided on the campus to house all the students. The building of dormitories has steadily progressed since that time until the completion of the dormitory named in his honor, which provides accommodation for the last of those remaining outside the campus. In addition to this new dormitory, two other buildings were completed during the year and were opened in September, 1912. These were the Sloane physics laboratory, erected at a cost of \$400,000 by William D. Sloane and Henry T. Sloane of New York City, and the Day mission library, erected from the bequests of Professor George E. Day, formerly of the divinity school faculty. It is the only building of its kind in America devoted exclusively to a library of foreign missions. The university laboratory of biology and zoölogy approached completion at the beginning of the collegiate year. The annual report of the treasurer showed that bequests during 1911-12

amounted to \$1,164,715, as compared with \$1,134,385 in 1910-11.

YASS-CANBERRA. See CITY PLANNING.

YEAMANS, ANNIE. An American actress, died March 1, 1912. She was born in 1835 in the Isle of Wight, and was taken by her parents while still a child, to Sydney, New South Wales. She played in Australia for two seasons in the circus and in 1853 married Edward Yeamans. Her first appearance in New York was in *Cendrillon*. She also appeared in *The Ticket of Leave Man*. She played for a short time in Daly's Theatre, which she left to enter upon a long engagement with Harrigan and Hart at the Theatre Comique. Here she became notable for her impersonation of Irish characters. When Harrigan's dramas ceased to be given Mrs. Yeamans appeared under many managements and in a great variety of plays both in England and the United States. She was one of the oldest actresses on the stage, and was for half a century a favorite with the playgoing public.

YOSHI-HITO, HARUNOMIA. Emperor of Japan, succeeding at the death of his father, Mutsuhito (q. v.). The name Yoshi-Hito signifies "good man." He was born August 31, 1879, the son of Princess Yanigawara, one of the eight princesses of noble blood, who became members of the household of the emperor. His two older brothers died soon after birth. He was nominated as heir-apparent on his eighth birthday and he at that time received the decoration of the Grand Order of Merit and a commission as a colonel in the Imperial Royal Guards. He was educated at the school for members of the imperial royal family at Tokyo. It comprised modern training as well as the old Japanese studies. The emperor speaks English, French, and German. In 1900 he married Princess Sada, his cousin. Yoshi-Hito was a lieutenant-colonel in the army and vice-admiral in the navy. Although his disposition is said to be toward liberal and modern ideas, he is also said to display a desire to maintain so much of ancient tradition as will not interfere with the real progress of his country. The emperor and empress have three children, Princess Michi, Atsu, and Teru. The first-named is the heir-apparent and is the first son to have been born to either an empress or a crown princess in many generations.

YOUNG, ALFRED HARRY. An English anatomist and educator, died February 24, 1912. He was born in Warrington and graduated in medicine at Edinburgh University in 1876. He was appointed demonstrator of anatomy in the Medical School of that university, and in 1877 removed to Manchester to take a similar position in Owens College. In 1885 he was elected to the chair of anatomy in that institution and was at the same time dean of the medical school. He was connected with the Salford Royal Hospital until 1903, when he resigned and was appointed honorary consulting surgeon. In 1902 he resigned as dean of the medical school. He continued to lecture until 1909, when he vacated the chair on account of ill health. He was then made professor emeritus. He contributed to numerous papers and to medical journals and was the editor of *Studies in Anatomy from the University of Manchester*, and was also a former editor of the *Medical Chronicle*.

YOUNG, LUCIEN. A rear-admiral of the

United States navy, died October 2, 1912. He was born in Lexington, Ky., in 1852, and graduated from the United States Naval Academy in 1873. In the same year he was made a midshipman. While still a midshipman serving on the *Alaska*, he jumped overboard on July 23, 1873, and rescued a seaman while the ship was under way at sea. The act received mention by the Secretary of the Navy in general orders, and Midshipman Young was awarded a gold medal by the New York Benevolent and Live Saving Institution, and a certificate by the Humane Society of Massachusetts. He was one of the officers on board the *Huron*, which was wrecked off Nag's Head, N. C. Here he distinguished himself in the rescue of members of the ship's company, only twelve of whom were saved. On this occasion he received the thanks of the Secretary of the Navy and a gold medal from the United States Live-Saving Service. He was presented with a sword by the Kentucky legislature and was made an honorary member of that body. He was also advanced to the rank of master by special act of Congress at the nomination of the President. In 1878 he was sent on special duty to the Paris Exposition. While in that city he declined a medal from the Legion of Honor. He afterwards declined a medal offered by the king of Portugal for heroism in saving five persons from a wreck off the mouth of the Tagus River. In 1877, after serving on various ships and in the Bureau of Equipment, he became instructor in the Naval War College. For much of the time in the few years following he was in the Bureau of Equipment, the office of the Secretary of the Navy, and the War Records office. During the revolution in Hawaii he was in service there and he severely attacked Queen Liliuokalani before the Senate committee which investigated that revolution. At the outbreak of the Spanish-American War he was on sick leave, but he was called back to active service and put in command of the gunboat *Hist*. He was advanced three numbers for meritorious conduct in that war. From 1899 to 1900 he was commander of the port of Havana and was then made commandant of the United States naval station at Havana. For services rendered during a severe storm which occurred while at this post he received a commendatory letter from the mayor and City Council of Havana. After two years spent in the light-house service he was given command of the *Bennington* and was in command of this vessel when its boilers exploded off San Diego, Cal., in July, 1905. Commander Young was court-martialed in connection with this accident, but was vindicated, the court finding the boilers defective and that Commander Young had so reported them before the accident. At the time of the San Francisco earthquake he was commander of the Mare Island Navy Yard and his work of relief received mention by the Secretary of the Navy. From Mare Island he was transferred to Key West. In 1910 he was promoted to the rank of rear-admiral. He was the author of a standard work on navigation, *Archæological Researches in Peru*, and *The Real Hawaii*.

YOUNG MEN'S CHRISTIAN ASSOCIATION. The international committee of the Y. M. C. A. in its present form was created by the international convention of 1866. It now consists of 70 members and 22 advisory

members, resident in the United States and Canada, who are elected by delegates sent from the local associations to the triennial conventions. Its headquarters are at 124 East 28th Street, New York City, with branch offices in Chicago, Montreal, and other important centres. The committee employs a force of 111 executive, traveling, and office secretaries on the North American field, besides a staff of 128 secretaries engaged in planting the American type of association work in the important centres of the non-Christian world. The present chairman of the international committee is Alfred E. Marling of New York City, and at the head of the committee's secretarial staff are Richard C. Morse, who has been the general secretary since 1869, and John R. Mott, who, as associate general secretary, has general charge of the student work and work in foreign lands. The international committee exists, not as an end in itself, but solely to aid and strengthen the local associations through a service of counsel and coöperation. The next triennial convention of the Young Men's Christian Associations will be held in Los Angeles, May 8-12, 1913.

In 1912 there were 8612 associations in the world, of which 2192 were in North America. The total membership of the American associations was 563,479. These associations occupy 756 buildings of their own and have 570 libraries. In the evening educational classes were 67,417 young men as students, and in the physical departments 300,590. In the Bible classes were 103,599 students. The general secretaries and other paid officials numbered 3633. The expenditures for current expenses amounted to \$11,302,547.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION OF THE UNITED STATES OF AMERICA, NATIONAL BOARD OF. Affiliated with the national board of this association are 208 city and town associations, 660 in colleges and schools, and 7 in counties, or 875 in all, a total membership of 253,406. The national board opened in September, 1912, at Fifty-second street and Lexington avenue, New York City, a new building for the administrative offices and for the national training school, which offers a one-year post-graduate course for the association secretaryships. The national board conducted in 1912 eleven city and student conferences in which over 4000 young women were given ten days of rest, recreation, and grounding in Christian fundamentals.

YUAN SHIH-KAI. See CHINA.

YUKON. A territory of the Dominion of Canada. Area, 207,076 square miles. Population (census of June 1, 1911), 8512, as compared with 27,219 in 1901. Dawson, the capital, had 3013 inhabitants (9142 in 1901). Commissioner, George Black.

ZANZIBAR. An island (640 square miles—the largest coralline island on the African coast) which, with Pemba (380 square miles) and several other small islands, constitutes a British protectorate. Population (census 1910), 197,199 (300 Europeans, about 10,000 Arabs, and about 20,000 Indians). The bulk of the population is Swahili. Mohammedanism is the prevailing religion. Imports (1910), £993,031; exports, £1,033,467 (cloves, £253,470; copra and chikichi, £219,369; grain, £50,385; ivory, £60,844; gum copal, £11,802; hides and skins, £10,060; bullion and specie, £55,507). Revenue

(1910) £181,705; expenditure, £192,925; debt, £75,573. British agent and consul-general, Edward Clarke, residing at Zanzibar. Sultan, Seyyid Ali.

ZAPATA, EMILIANO. See MEXICO.

ZEAL, Sir WILLIAM AUSTIN. An Australian public official, died March, 1912. He was born in Westbury, Wiltshire, England, in 1830, and was educated privately. In 1852 he went to Australia, where for a time he was engaged as a railway engineer and subsequently in farming. He became a member of the Legislative Assembly of Victoria, 1864, and a member of the Legislative Council for the North-west provinces in 1881 and of the North Central provinces in 1882. In 1892 he was post-master-general and from 1892 to 1901 was president of the Legislative Council of Victoria. He took a prominent part in the federal movement and was a member of the national convention which framed the Commonwealth constitution in 1897-8. He was elected to the first Commonwealth Senate for Victoria in 1901. He was made a K. C. M. G. in 1895.

ZEPPELIN. See NAVAL PROGRESS.

ZEPPELIN AIRSHIP. See AERONAUTICS.

ZINC. The production of primary spelter, which is the ore of zinc, from domestic ores in 1911 was 271,621 short tons, valued at \$30,964,794 compared with 252,479 short tons, valued at \$27,267,732 in 1910. The total production of spelter from both domestic and foreign ores in 1911 was the greatest in the history of the zinc-smelting industry in the United States, being 286,526 short tons compared with 269,184 tons in 1910, a gain of 17,342 tons or 6.4 per cent. Together with the increase in the production, there was a large increase in the consumption, which was nearly 10,000,000 tons greater than the abnormal consumption of 1909. The largest quantity of spelter was produced in Missouri, 127,540 tons. This State surpassed all others in production. In Colorado, 42,233 tons were mined; in Montana, 22,115; in Wisconsin, 31,809, and in New Jersey, 15,128. There are the only States in which spelter is produced in large quantities. The exodus of zinc splatters from Kansas which began in 1910, continued in 1911. Of 16 plants which were in existence in 1910, but 10 were left at the close of 1911. The total amount of crude ore mined in 1911, including zinc ore, zinc lead ore, and all other ore, was 44,141,006 tons. From this was recovered 345,260 short tons of zinc content.

The zinc imported into the United States in 1911 was valued at \$110,123. This included block or pigs, sheets, and old zinc. The exports were valued at \$1,935,677. These included zinc ore, plates, sheets, pigs or bars, and zinc dross.

WORLD PRODUCTION. The world's production of spelter in 1911 was 978,695 short tons. Of this, the largest quantity, 286,526 tons, was produced in the United States. In Germany 276,008 tons were produced, and in Belgium, 215,050. Other countries producing quantities ranging from 18,000 to 73,000 tons were Austria, France, Spain, Great Britain, Holland, and Poland.

The production of zinc in the United States in 1912 was 347,922 short tons. Of this amount 110,724 tons were produced in Missouri and Kansas, 94,886 in Illinois, 77,524 in Oklahoma, and 56,083 in the eastern States. These figures are taken from the *Engineering and*

Mining Journal. See also METALLURGY, and CHEMISTRY, INDUSTRIAL.

XENON. See PHYSICS.

ZOOLOGY. Zoölogical research in 1912, as in previous years, was conducted along both observational and experimental lines. A good deal of this work had distinctly an economic importance. See ENTOMOLOGY, FISH AND FISHERIES, and BIOLOGY.

A standing committee of the International Congresses of Zoölogy is one on nomenclature, appointed to devise some remedy for the present chaotic condition of zoölogical nomenclature. Much controversy was excited during the year by the report from this committee that they propose to apply in all cases the rule of priority, a procedure that may make it necessary to change some long established usages. See YEAR BOOK for 1907. Zoölogists whose work is mainly systematic seem in favor of applying the priority rule, while others apparently prefer not to give up familiar names, and suggest that the committee prepare an official list, which need not in all cases follow the priority rule.

PHYLOGENETIC SPECULATION. While much in vogue some twenty or more years ago, phylogenetic speculation has received of late very little attention from zoölogists. An important book of the year along this line is Patten's *The Evolution of the Vertebrates and Their Kin*, in which the author develops a theory as to the origin of the vertebrate phylum. Patten's theory, upon which he has been working since 1884, and which has been outlined in a number of earlier papers, is that the vertebrates have descended from the arachnids, including the trilobites and *Limulus* in this group. The fossil *Ostracodermata* he regards as a connecting link between the arachnids and the true vertebrates.

PROTOZOA. The question as to the meaning of conjugation in the protozoa was apparently still unsettled. Woodruff reported results in agreement with those of his earlier papers. See YEAR BOOK for 1911. A pedigreed culture of *Paramæcium*, which he had kept through 3029 generations, was still in good condition, though there had been no conjugation during that time. From these results he concluded that the protoplasm of a single cell may be sufficient to reproduce itself indefinitely under favorable environmental conditions, without recourse to conjugation. Senescence and need of fertilization are not primary attributes of living matter. Baitsell studied *Stylonychia*, and concluded that conjugation periods are a result of a peculiar stimulation due to external conditions, and have no relation whatever to a "life-cycle."

CELENTERATES. Annandale recorded a case where sea anemones had been kept in an aquarium for over fifty years, indicating that the normal life of these animals must be even longer than this.

NEMATODES. Loos, in *Records of School of Medicine*, published by the Ministry of Education in Egypt, on the life history of the hookworm, *Ankylostoma duodenalis*, and the American form, *Necator americanus*, reported that in both cases thirty days elapse between the time of infection and the time when the eggs appear in the feces of the victim.

ANNELIDA. Shearer stated that in *Dinophilus gyrotilatus* the immature females are fer-

tilized while still within the egg capsule, the sperm being recognizable in the body of the female before any eggs have appeared. When these latter arise, they enter into such relations with the spermatozoa, that the nucleus of the oögonium is of double nature, one portion being derived from the sperm, the other from the oögonium itself. Later divisions are such that in some cells the female part of the compound nucleus divides before the male, so that of the two daughter cells, one has all of the male, and half of the female nucleus, while the other has only female. The former gives rise to a female adult, the latter to a male. If the nucleus divides equally, the resulting cells degenerate. Whitney stated that the rotifer *Hydatina senta*, if forced to breed parthenogenetically for 384 generations, showed a gradual decrease in the rate of reproduction, but that cross fertilization of such weakened races caused a sudden increase in the reproduction rate of the ensuing race.

CRUSTACEA. Megusar, experimenting on the chromatophores of decapod crustacea, found that light exerts a direct influence in that a certain amount of light is essential, for the appearance of the color. The eyes also are of importance in producing the color variations, blinding of the animals being followed by a complete loss of color. Color disappears if the animal is kept in the dark, the loss being greater if it be blinded at the same time.

FISH. See FISH AND FISHERIES.

AMPHIBIA. Kammerer discovered interesting correlations between the environment and the structure of the blind amphibian, *Proteus anguinus*. If kept below 15° C. it is viviparous. If above 15° C. it lays eggs, one and the same female being either oviparous or viviparous according as it is kept at the lower or the higher temperature. In the dark the animal is colorless, but becomes pigmented if kept in daylight, the change being greater the brighter the light, the higher the temperature, the longer it is exposed to it, and the younger and better nourished the animal is. Offspring of the pigmented forms are pigmented, whether born in the dark or in the light. The eye is imperfect and soon degenerates in the embryo, though if kept in the light this degeneration soon ceases. Smith studied the embryology of *Cryptobranchus alleganiensis*. Egg laying takes place in August and September, the eggs being laid in definite nests. The male guards the nest after the eggs are laid, possibly to protect the eggs, though both male and female will eat them. Smith suggested that possibly the male eats fewer of them than does the female.

MAMMALS. The Stefansson-Anderson expedition in Arctic America returned in 1912, having covered the coast region of Alaska east of the Colville River, and the Barren Grounds of the Yukon and Makenzie districts east to Coronation Gulf. Large collections of birds and mammals were reported, of especial importance being caribou material, and a series of 17 specimens of the little known, Barren Ground bear, a form not yet thoroughly studied, but apparently related to the grizzly. Baker reported that experiments in breeding black bear have been successfully carried on for the past 21 years at a private park near Akron, O. Sixty-eight or sixty-nine cubs have been produced during this time, of which only one died. Con-

trary to the usual assumption, the bear is quite fat when it emerges from its winter hibernation.

Townsend reported that the elephant seal, *Macrorhinus angustirostris*, formerly much hunted for oil, but which has seldom been seen since 1852, is still to be found at Guadalupe, a small island 140 miles from Lower California. The proboscis is not capable of inflation and apparently appears only at the time of sexual maturity. The males have a length of 16 feet with a girth of 11 feet, while the females are about 11 feet long. The Mexican

government has taken steps to protect this herd. The discovery of a shrew, *Microscolex winnemana*, from Virginia, was announced in 1912. The specimens measured 76 and 86 mm. respectively, making it the smallest mammal yet described from North America. In 1911 the first natural history collection ever made in the Mount Robinson region of the Canadian Rockies resulted in the discovery of four new mammals, a chipmunk, a manteled ground squirrel, and two bats, which have since been described by Hollister.
